

Features

- Output Adjustable between 1.2V and 37V
- Output current up to 1.5A
- Internal Thermal Overload Protection
- internal thermal Overload protection
- Output transistor safe area compensation

Applications

- HVAC Systems
- SMPS Post Regulation
- Test and Measurement Equipment
- Industrial Power Supplies

PIN CONFIGURATION

Pin Number	Pin Name	Pin Function
1	ADJ	Adjust pin
2	VOUT	Output of the Regulator
3	VIN	Input of Supply Voltage

Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

SYMBOL	PARAMETER	RATINGS	UNIT
$V_i - V_o$	Input-Output Voltage Differential	40	V
P_D	Power Dissipation	Internally Limited	W
T_J	Operating Junction Temperature Range	+125	°C
T_{stg}	Storage temperature range	-65~ +150	°C
T_{opr}	Operating Temperature	-40 ~ +85	°C

THERMAL DATA

PARAMETER	SYMBOL	RATINGS	UNIT
Junction to Ambient	θ_{JA}	103	°C/W
Junction to Case	θ_{JC}	12.2	°C/W

2. C_{ADJ}, when used, is connected between the adjustment pin and ground.

3. Power dissipation within an IC voltage regulator produces a temperature gradient on the die, affecting individual IC components on the die. These effects can be minimized by proper integrated circuit design and layout techniques. Thermal Regulation is the effect of these temperature gradients on the output voltage and is expressed in percentage of output change per watt of power change in a specified time.

4. Since Long Term Stability cannot be measured on each device before shipment, this specification is an engineering estimate of average stability from lot to lot.

Typical Application Circuit

$$V_{OUT} = 1.25V \times (1 + R2/R1) + I_{ADJ} \times R2$$

C1 is required when regulator is located an appreciated distance from power supply. Co is needed to improve transient response.

Regulator with On-off control

Soft Start Application

$$I_{O(MAX)} = \left(\frac{V_{REF}}{R1} \right) + I_{ADJ} = \frac{1.25V}{R1}$$

$$I_{O(MIN)} = \left(\frac{V_{REF}}{R1+R2} \right) + I_{ADJ} = \frac{1.25V}{R1+R2}$$
