
PART NUMBER**9601BCA-ROCV**

**Rochester Electronics
Manufactured Components**

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All re-creations are done with the approval of the Original Component Manufacturer. (OCM)

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-38535
 - Class Q Military
 - Class V Space Level

Qualified Suppliers List of Distributors (QSLD)

- Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OCM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

National Semiconductor is now part of
Texas Instruments.

9601/DM9601 Retriggerable One Shot

General Description

These retriggerable one shots provide the designer with four inputs; two active high and two active low. This permits a choice of either leading-edge or trailing-edge triggering, independent of input transition times. When input conditions for triggering are met, a new cycle starts and the external capacitor is rapidly discharged and then allowed to charge again. The retriggerable feature allows for output pulse widths to be expanded. In fact a continuous true output can be maintained by having an input cycle time which is shorter than the output cycle time. Retriggering may be inhibited by tying the \bar{Q} output to an active low input.

Features

- High speed operation—input repetition rate > 10 MHz
- Flexibility of operation—optional retriggering/lock-out capability
- Output pulse width range—50 ns to ∞
- Leading or trailing edge triggering
- Complementary outputs/inputs
- Input clamping diodes
- DTL/TTL compatible logic levels
- Alternate Military/Aerospace device (9601) is available. Contact a National Semiconductor Sales Office/Distributor for specifications.

Absolute Maximum Ratings (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage	7V
Input Voltage	5.5V
Operating Free Air Temperature Range	
Military	−55°C to +125°C
Commercial	0° to +70°C
Storage Temperature Range	−65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

R_X	External Timing Resistor		DM86		50	k Ω	

Operating Rules

1. An external resistor R_X and an external capacitor C_X are required for operation. The value of R_X can vary between the limits shown in switching characteristics. The value of C_X is optional and may be adjusted to achieve the required output pulse width.

2. Output pulse width t_{PW} may be calculated as follows:

$$t_{PW} = K R_X C_X \left[1 + \frac{0.7}{R_X} \right] \quad (\text{for } C_X > 10^3 \text{ pF})$$

$K \approx 0.34$

R_X in k Ω , C_X in pF and t_{PW} in ns.

(For $C_X < 10^3$ pF, see curve.)

3. R_X and C_X must be kept as close as possible to the circuit in order to minimize stray capacitance and noise pickup. If remote trimming is required, R_X may be split up such that at least $R_{X(MIN)}$ must be as close as possible to the circuit and the remote portion of the trimming resistor $R < R_{X(MAX)} - R_X$.
4. Set-up time (t_1) for input trigger pulse must be > 40 ns. (See Figure 1).
- Release time (t_2) for input trigger pulse must be > 40 ns. (See Figure 2).

FIGURE 1

FIGURE 2

5. Retrigger pulse width (see Figure 3) is calculated as follows:

$$t_W = t_{PW} + t_{PLH} = K R_X C_X \left[1 + \frac{0.7}{R_X} \right] + t_{PLH}$$

FIGURE 3

Typical "K" Coefficient Variation vs Timing Capacitance

The multiplicative factor "K" varies as a function of the timing capacitor, C_X . The graph below details this characteristic:

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
