 | $C_{SAMPLE}$ | Sample and hold capacitance at maximum gain <sup>34</sup>                                                                                |      | 2.5  |      | pF    |
| $R_{INPUT}$  | Input resistance                                                                                                                         |      | >1   |      | MΩ    |
| $E_{NOB}$    | Effective number of bits, differential mode, 12-bit resolution, 1/1 gain, 3 μs acquisition time, crystal HFCLK, 200 kps                  |      | 9    |      | Bit   |
| $S_{NDR}$    | Peak signal to noise and distortion ratio, differential mode, 12-bit resolution, 1/1 gain, 3 μs acquisition time, crystal HFCLK, 200 kps |      | 56   |      | dB    |
| $S_{FDR}$    | Spurious free dynamic range, differential mode, 12-bit resolution, 1/1 gain, 3 μs acquisition time, crystal HFCLK, 200 kps               |      | 70   |      | dBc   |
| $R_{LADDER}$ | Ladder resistance                                                                                                                        |      | 160  |      | kΩ    |

**Figure 105: Model of SAADC input (one channel)**

Note: SAADC average current calculation for a given application is based on the sample period, conversion and acquisition time ( $t_{CONV}$  and  $t_{ACQ}$ ) and conversion and idle current ( $I_{ADC,CONV}$  and  $I_{ADC,IDLE}$ ). For example, sampling at 4kHz gives a sample period of 250μs. The average current consumption would then be:

$$I_{AVERAGE} = \left( \frac{t_{CONV} + t_{ACQ}}{250} \right) (I_{ADC,CONV}) + \left( \frac{250 - (t_{CONV} + t_{ACQ})}{250} \right) (I_{ADC,IDLE})$$

**Figure 106: ADC INL vs Output Code**

refresh mode will not be allowed, and it will remain in normal mode from the START task to the STOPPED event. So depending on  $t_{ACQ}$  and other resources' needs, the appropriate base current needs to be taken into account.

<sup>b</sup> Does not include temperature drift

<sup>34</sup> Maximum gain corresponds to highest capacitance.

**Figure 107: ADC DNL vs Output Code**

**Figure 108: FFT of a 2.8 kHz sine at 200 ksps ()**

### 37.13 Performance factors

Clock jitter, affecting sample timing accuracy, and circuit noise can affect ADC performance.

Jitter can be between START tasks or from START task to acquisition. START timer accuracy and startup times of regulators and references will contribute to variability. Sources of circuit noise may include CPU activity and the DC/DC regulator. Best ADC performance is achieved using START timing based on the TIMER module, HFXO clock source, and Constant Latency mode.

The Comparator (COMP) compares the input voltage (VIN+) that is derived from an analog input pin selected via the PSEL register against a second input voltage (VIN-) that can be derived from multiple sources depending on operation mode.

- Input range from 0 V to VDD
- Single-ended mode
  - Fully flexible hysteresis using a 64-level reference ladder
- Differential mode
  - Configurable 50 mV hysteresis
- Reference inputs:
  - VDD
  - External reference from AIN0 to AIN1 (between 0 V and VDD)
  - Internal references 1.2 V, 1.8 V and 2.4 V
- Three operation modes: low power, normal and high-speed
- Single-pin capacitive sensor support
- Event generation on output changes
  - UP event on  $VIN^- > VIN^+$
  - DOWN event on  $VIN^- < VIN^+$
  - CROSS event on  $VIN^+$  and  $VIN^-$  crossing
  - READY event on core and internal reference (if used) ready

**Important:** COMP cannot be used (STARTed) at the same time as LPCOMP. Only one comparator can be used at a time.

<sup>35</sup> See  $t_{\text{PROPDLY,LP}}$ ,  $t_{\text{PROPDLY,N}}$ ,  $t_{\text{PROPDLY,HS}}$ ,  $I_{\text{COMP,LP}}$ ,  $I_{\text{COMP,N}}$  and  $I_{\text{COMP,HS}}$  in [Electrical parameters](#) for more information about COMP speed and power characteristics related to these different modes.

to use and the output of the COMP is correct. When the COMP module is started, events will be generated every time VIN+ crosses VIN-.

VIN- can be derived directly from AIN0 or AIN1 in differential mode, or VREF in single-ended mode. VUP and VDOWN thresholds can be set to implement a hysteresis on VIN- using the Reference Ladder. VREF can be derived from VDD, AIN0, AIN1 or internal 1.2V, 1.8V and 2.4V references.

An upward crossing will generate an UP event and a downward crossing will generate a DOWN event. The CROSS event will be generated every time there is a crossing, independent of direction.

An optional hysteresis on VIN+ and VIN- can be enabled when the module is used in differential mode through the HYST register. In single ended mode the two reference ladders (VUP and VDOWN, see [Figure 112: Comparator in single-ended mode](#) on page 395) will be used instead of the hysteresis mechanism configured in HYST.

This hysteresis is in the order of magnitude of 50 mV, and shall prevent noise on the signal to create unwanted events. See [Figure 113: Hysteresis example where VIN+ starts below VUP](#) on page 395 for illustration of the effect of an active hysteresis on a noisy input signal.

The COMP can be configured to operate in two main operation modes, differential mode and single-ended mode, see MODE register for more information.

The COMP can, for both main operation modes, operate in different speed and power consumption modes, see MODE register. High-speed mode will consume more power compared to low-power mode, and low-power mode will result in slower response time compared to high-speed mode.

The immediate value of the COMP can be sampled to the RESULT register by triggering the SAMPLE task.

A selectable current can be applied (ISOURCE register) on the currently selected AINx line. Enabling the block creates a feedback path around the comparator, forming a relaxation oscillator. The circuit will sink current from VIN+ when the comparator output is high, and source current into VIN+ when the comparator output is low. The frequency of the oscillator is dependent on the capacitance at the analog input pin, the reference voltages and the value of the current source. In this mode, only a capacitive sensor needs to be attached between the analog input pin and ground. With a selected current of 10  $\mu$ A, VUP-VDOWN equal to 1 V, and an external capacity of typically 10 pF, the resulting oscillation frequency is around 500 kHz.

The frequency of the oscillator can be calculated as

$$f_{OSC} = I_{SOURCE} / (2C \cdot (VUP - VDOWN))$$

## 38.1 Shared resources

The COMP shares analog resources with the SAADC and LPCOMP peripherals.

While it is possible to use SAADC at the same time as COMP or LPCOMP, COMP and LPCOMP are mutually exclusive: enabling one will automatically disable the other. In addition, when using SAADC and COMP or LPCOMP simultaneously, it is not possible to select the same analog input pin for both modules.

**Important:** The COMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has stopped. Failing to do so may result in unpredictable behaviour.

## 38.2 Differential mode

In differential mode, the reference input VIN- is derived directly from one of the AINx pins.

In this mode, the impedance on VIN-'s signal path is equal to the impedance on VIN+'s signal path. See Z<sub>COMPVINP</sub> and Z<sub>COMPVINND</sub> for more information. In differential mode, the PSEL, MODE and EXTREFSEL registers must be configured before the COMP is enabled via the ENABLE register. When HYST is turned on while in this mode, the Output of the comparator (and associated events) will change from ABOVE to BELOW whenever VIN+ becomes smaller than (VIN- - (V<sub>DIFFHYST</sub> / 2)). Similarly, it will change from BELOW to ABOVE whenever VIN+ becomes larger than (VIN- + (V<sub>DIFFHYST</sub> / 2)), as illustrated in [Figure 111: Hysteresis enabled in differential mode](#) on page 394.

**Restriction:** Depending on the device, not all the analog inputs may be available for each MUX.

**Figure 110: Comparator in differential mode**

**Figure 111: Hysteresis enabled in differential mode**

### 38.3 Single-ended mode

In single-ended mode, VIN- is derived from the Reference Ladder.

The Reference Ladder uses the reference voltage VREF to derive two new voltage references, VUP and VDOWN. VUP and VDOWN are configured via THUP and THDOWN in the TH register. VREF can be sourced from any of the available references sources as illustrated in [Figure 112: Comparator in single-ended mode](#) on page 395. This is configured via EXTREFSEL and REFSEL.

When the comparator core detects that  $VIN+ > VIN-$ , i.e. ABOVE as per the RESULT register, VIN- will switch to VDOWN. When VIN- falls below VIN- again, VIN- will be switched back to VUP. By specifying VUP larger than VDOWN, a hysteresis as illustrated in [Figure 113: Hysteresis example where VIN+ starts below VUP](#) on page 395 and [Figure 114: Hysteresis example where VIN+ starts above VUP](#) on page 396 can be generated. In single-ended mode, the PSEL, MODE, EXTREFSEL, REFSEL and TH registers must be configured before the COMP is enabled via the ENABLE register.

**Restriction:** Depending on the device, not all the analog inputs may be available for each MUX.

Writing to the HYST register has no effect in single-ended mode, and the content of this register is ignored.

Figure 112: Comparator in single-ended mode

Figure 113: Hysteresis example where  $V_{IN+}$  starts below  $V_{UP}$

Figure 114: Hysteresis example where VIN+ starts above VUP

## 38.4 Pin configuration

The user can use the PSEL register to select one of the analog input pins, AIN0 through AIN7, as input VIN+.

See [Figure 112: Comparator in single-ended mode](#) on page 395. Similarly the user can use the EXTREFSEL register to select one of the AINx analog input pins as reference input, in case AREF is selected in REFSEL. The selected analog pins will be acquired by the COMP when it is enabled via the ENABLE register.

Depending on the device, not all the analog inputs may be available for each MUX. See PSEL and EXTREFSEL register definition for more information about which analog pins are available on a particular device.

## 38.5 Registers

Table 91: Instances

| Base address | Peripheral | Instance | Description                | Configuration |
|--------------|------------|----------|----------------------------|---------------|
| 0x40013000   | COMP       | COMP     | General purpose comparator |               |

Table 92: Register Overview

| Register                 | Offset | Description                       |
|--------------------------|--------|-----------------------------------|
| TASKS_START              | 0x000  | Start comparator                  |
| TASKS_STOP               | 0x004  | Stop comparator                   |
| TASKS_SAMPLE             | 0x008  | Sample comparator value           |
| EVENTS_READY             | 0x100  | COMP is ready and output is valid |
| EVENTS_DOWN              | 0x104  | Downward crossing                 |
| EVENTS_UP                | 0x108  | Upward crossing                   |
| EVENTS_CROSS             | 0x10C  | Downward or upward crossing       |
| <a href="#">SHORTS</a>   | 0x200  | Shortcut register                 |
| <a href="#">INTEN</a>    | 0x300  | Enable or disable interrupt       |
| <a href="#">INTENSET</a> | 0x304  | Enable interrupt                  |

| Register         | Offset | Description                                 |
|------------------|--------|---------------------------------------------|
| <i>INTENCLR</i>  | 0x308  | Disable interrupt                           |
| <i>RESULT</i>    | 0x400  | Compare result                              |
| <i>ENABLE</i>    | 0x500  | COMP enable                                 |
| <i>PSEL</i>      | 0x504  | Pin select                                  |
| <i>REFSEL</i>    | 0x508  | Reference source select                     |
| <i>EXTREFSEL</i> | 0x50C  | External reference select                   |
| <i>TH</i>        | 0x530  | Threshold configuration for hysteresis unit |
| <i>MODE</i>      | 0x534  | Mode configuration                          |
| <i>HYST</i>      | 0x538  | Comparator hysteresis enable                |
| <i>ISOURCE</i>   | 0x53C  | Current source select on analog input       |

| I <sub>COMP,HS</sub>    | Core run current in high-speed mode                                      |      | 10   |      | μA    |
| t <sub>PROPDLY,LP</sub> | Propagation delay, low power mode <sup>a</sup>                           |      | 0.6  |      | μS    |
| t <sub>PROPDLY,N</sub>  | Propagation delay, normal mode <sup>a</sup>                              |      | 0.2  |      | μS    |
| t <sub>PROPDLY,HS</sub> | Propagation delay, high-speed mode <sup>a</sup>                          |      | 0.1  |      | μS    |
| I <sub>SOURCE</sub>     | Configurable input current provided by the output driven current source. |      |      |      | μA    |
| I <sub>SOURCE,A</sub>   |                                                                          |      | 2.5  |      | μA    |
| I <sub>SOURCE,B</sub>   |                                                                          |      | 5.0  |      | μA    |
| I <sub>SOURCE,C</sub>   |                                                                          |      | 10.0 |      | μA    |

<sup>a</sup> Propagation delay is with 10mV overdrive.

| Symbol               | Description                                                                     | Min. | Typ. | Max. | Units      |
|----------------------|---------------------------------------------------------------------------------|------|------|------|------------|
| $V_{DIFFHYST}$       | Optional hysteresis applied to differential input                               |      | 30   |      | mV         |
| $V_{VDD-VREF}$       | Required difference between VDD and a selected VREF, $V_{DD} > V_{REF}$         | 0.3  |      |      | V          |
| $I_{INT\_REF}$       | Current used by the internal bandgap reference when selected as source for VREF |      | 13   |      | $\mu A$    |
| $t_{INT\_REF,START}$ | Startup time for the internal bandgap reference                                 |      | 50   | 80   | $\mu S$    |
| $E_{INT\_REF}$       | Internal bandgap reference error                                                | -3   |      | 3    | %          |
| $R_{LADDER}$         | Reference ladder resistance, $I_{LADDER} = V_{REF} / R_{LADDER}$                |      | 550  |      | k $\Omega$ |
| $V_{INPUTOFFSET}$    | Input offset                                                                    | -10  |      | 10   | mV         |
| $D_{NLLADDER}$       | Differential non-linearity of reference ladder                                  |      | <0.1 |      | LSB        |
| $t_{COMP,START}$     | Startup time for the comparator core                                            |      | 3    |      | $\mu S$    |

Total comparator run current must be calculated from the  $I_{COMP}$ ,  $I_{INT\_REF}$ ,  $I_{SOURCE}$  and  $I_{LADDER}$  values for a given reference voltage.

## 39 LPCOMP — Low power comparator

LPCOMP compares an input voltage against a reference voltage.

Listed here are the main features of LPCOMP:

- 0 - VDD input range
- Ultra low power
- Eight input options (AIN0 to AIN7)
- Reference voltage options:
  - Two external analog reference inputs, or
  - 15-level internal reference ladder (VDD/16)
- Optional hysteresis enable on input
- Wakeup source from OFF mode

In System ON, the LPCOMP can generate separate events on rising and falling edges of a signal, or sample the current state of the pin as being above or below the selected reference. The block can be configured to use any of the analog inputs on the device. Additionally, the low power comparator can be used as an analog wakeup source from System OFF or System ON. The comparator threshold can be programmed to a range of fractions of the supply voltage.

**Restriction:** LPCOMP cannot be used (STARTed) at the same time as COMP. Only one comparator can be used at a time.

**Figure 115: Low power comparator**

The wakeup comparator (LPCOMP) compares an input voltage (VIN+), which comes from an analog input pin selected via the PSEL register against a reference voltage (VIN-) selected via the [REFSEL](#) on page 408 and [EXTREFSEL](#) registers.

The [PSEL](#), [REFSEL](#), and [EXTREFSEL](#) registers must be configured before the LPCOMP is enabled through the [ENABLE](#) register.

The [HYST](#) register allows enabling an optional hysteresis in the comparator core. This hysteresis is in the order of magnitude of 50 mV, and shall prevent noise on the signal to create unwanted events. See [Figure 116: Effect of hysteresis on a noisy input signal](#) on page 404 for illustration of the effect of an active hysteresis on a noisy input signal. It is disabled by default, and shall be configured before enabling LPCOMP as well.

The LPCOMP is started by triggering the START task. After a start-up time of  $t_{LPCOMP,STARTUP}$  the LPCOMP will generate a READY event to indicate that the comparator is ready to use and the output of the LPCOMP is correct. The LPCOMP will generate events every time VIN+ crosses VIN-. More specifically, every time VIN+ rises above VIN- (upward crossing) an UP event is generated along with a CROSS event. Every time VIN+ falls below VIN- (downward crossing), a DOWN event is generated along with a CROSS event. When

hysteresis is enabled, the upward crossing level becomes  $(V_{IN-} + V_{HYST}/2)$ , and the downward crossing level becomes  $(V_{IN-} - V_{HYST}/2)$ .

The LPCOMP is stopped by triggering the STOP task.

**Figure 116: Effect of hysteresis on a noisy input signal**

LPCOMP will be operational in both System ON and System OFF mode when it is enabled through the ENABLE register. See [POWER — Power supply](#) on page 78 for more information about power modes. Note that it is not allowed to go to System OFF when a READY event is pending to be generated.

All LPCOMP registers, including [ENABLE](#), are classified as retained registers when the LPCOMP is enabled. However, when the device wakes up from System OFF, all LPCOMP registers will be reset.

The LPCOMP can wake up the system from System OFF by asserting the ANADETECT signal. The ANADETECT signal can be derived from any of the event sources that generate the UP, DOWN and CROSS events. In case of wakeup from System OFF, no events will be generated, only the ANADETECT signal. See the ANADETECT register ([ANADETECT](#) on page 408) for more information on how to configure the ANADETECT signal.

The immediate value of the LPCOMP can be sampled to [RESULT](#) on page 407 by triggering the SAMPLE task.

See [RESETREAS](#) on page 85 for more information on how to detect a wakeup from LPCOMP.

## 39.1 Shared resources

The LPCOMP shares resources with other peripherals.

The LPCOMP shares analog resources with SAADC and COMP. While it is possible to use SAADC at the same time as COMP or LPCOMP, COMP and LPCOMP are mutually exclusive: enabling one will automatically disable the other. In addition, when using SAADC and COMP or LPCOMP simultaneously, it is not possible to select the same analog input pin for both modules.

The LPCOMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behaviour.

## 39.2 Pin configuration

You can use the LPCOMP.PSEL register to select one of the analog input pins, `AIN0` through `AIN7`, as the analog input pin for the LPCOMP.

See [GPIO — General purpose input/output](#) on page 111 for more information about the pins. Similarly, you can use [EXTREFSEL](#) on page 408 to select one of the analog reference input pins, `AIN0` and `AIN1`, as input for AREF in case AREF is selected in [EXTREFSEL](#) on page 408. The selected analog pins will be acquired by the LPCOMP when it is enabled through [ENABLE](#) on page 407.

## 39.3 Registers

**Table 93: Instances**

| Base address | Peripheral | Instance | Description          | Configuration |
|--------------|------------|----------|----------------------|---------------|
| 0x40013000   | LPCOMP     | LPCOMP   | Low power comparator |               |

**Table 94: Register Overview**

| Register     | Offset | Description                         |
|--------------|--------|-------------------------------------|
| TASKS_START  | 0x000  | Start comparator                    |
| TASKS_STOP   | 0x004  | Stop comparator                     |
| TASKS_SAMPLE | 0x008  | Sample comparator value             |
| EVENTS_READY | 0x100  | LPCOMP is ready and output is valid |
| EVENTS_DOWN  | 0x104  | Downward crossing                   |
| EVENTS_UP    | 0x108  | Upward crossing                     |
| EVENTS_CROSS | 0x10C  | Downward or upward crossing         |

|-----------------|--------------------------------------------------------------------------------------|------|------|------|---------|
| $I_{LPC}$       | Run current for low power comparator                                                 |      | 0.5  |      | $\mu A$ |
| $t_{LPCANADET}$ | Time from VIN crossing ( $\geq 50mV$ above threshold) to ANADETECT signal generated. |      | 5    |      | $\mu s$ |
| $E_{REFLADDER}$ | Error in reference ladder threshold voltage                                          | -30  |      | 30   | mV      |
| $V_{HYST}$      | Optional hysteresis                                                                  |      | 30   |      | mV      |

## 40 WDT — Watchdog timer

A countdown watchdog timer using the low-frequency clock source (LFCLK) offers configurable and robust protection against application lock-up.

The watchdog timer is started by triggering the START task.

The watchdog can be paused during long CPU sleep periods for low power applications and when the debugger has halted the CPU. The watchdog is implemented as a down-counter that generates a TIMEOUT event when it wraps over after counting down to 0. When the watchdog timer is started through the START task, the watchdog counter is loaded with the value specified in the CRV register. This counter is also reloaded with the value specified in the CRV register when a reload request is granted.

The watchdog's timeout period is given by:

$$\text{timeout [s]} = ( \text{CRV} + 1 ) / 32768$$

When started, the watchdog will automatically force the 32.768 kHz RC oscillator on as long as no other 32.768 kHz clock source is running and generating the 32.768 kHz system clock, see chapter [CLOCK — Clock control](#) on page 101.

### 40.1 Reload criteria

The watchdog has eight separate reload request registers, which shall be used to request the watchdog to reload its counter with the value specified in the CRV register. To reload the watchdog counter, the special value 0x6E524635 needs to be written to all enabled reload registers.

One or more RR registers can be individually enabled through the RREN register.

### 40.2 Temporarily pausing the watchdog

By default, the watchdog will be active counting down the down-counter while the CPU is sleeping and when it is halted by the debugger. It is however possible to configure the watchdog to automatically pause while the CPU is sleeping as well as when it is halted by the debugger.

### 40.3 Watchdog reset

A TIMEOUT event will automatically lead to a watchdog reset.

See [Reset](#) on page 82 for more information about reset sources. If the watchdog is configured to generate an interrupt on the TIMEOUT event, the watchdog reset will be postponed with two 32.768 kHz clock cycles after the TIMEOUT event has been generated. Once the TIMEOUT event has been generated, the impending watchdog reset will always be effectuated.

The watchdog must be configured before it is started. After it is started, the watchdog's configuration registers, which comprise registers CRV, RREN, and CONFIG, will be blocked for further configuration.

The watchdog can be reset from several reset sources, see [Reset behavior](#) on page 83.

When the device starts running again, after a reset, or waking up from OFF mode, the watchdog configuration registers will be available for configuration again.

## 40.4 Registers

**Table 95: Instances**

| Base address | Peripheral | Instance | Description    | Configuration |
|--------------|------------|----------|----------------|---------------|
| 0x40010000   | WDT        | WDT      | Watchdog timer |               |

**Table 96: Register Overview**

| Register                  | Offset | Description                                  |
|---------------------------|--------|----------------------------------------------|

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  ## 42 NFCT — Near field communication tag

The NFCT peripheral (referred to as the 'NFC peripheral' from now on) supports communication signal interface type A and 106 kbps bit rate from the NFC Forum.

With appropriate software, the NFC peripheral can be used to emulate the listening device NFC-A as specified by the NFC Forum.

Listed here are the main features for the NFC peripheral:

- NFC-A listen mode operation
  - 13.56 MHz input frequency
  - Bit rate 106 kbps
- Wake-on-field low power field detection (SENSE) mode
- Frame assemble and disassemble for the NFC-A frames specified by the NFC Forum
- Programmable frame timing controller
- Integrated automatic collision resolution, CRC and parity functions

### 42.1 Overview

The NFC peripheral is an implementation of an NFC Forum compliant listening device NFC-A.

**Figure 117: NFC block diagram**

The NFC peripheral contains a 13.56 MHz AM receiver and a 13.56 MHz load modulator compatible with the NFC-A technology defined in the NFC Forum with 106 kbps data rate.

The received frames will be automatically disassembled and the data part of the frame transferred to RAM. When transmitting, the frame data will be transferred directly from RAM and transmitted with configurable frame type and delay timing. The system will be notified by an event whenever a complete frame is received or sent.

It also supports the collision detection and resolution ("anticollision") as defined by the NFC Forum.

Wake-on-field is supported in SENSE mode while the device is either in System OFF or System ON mode. When the antenna enters an NFC field, an event will be triggered notifying the system to activate the NFC functionality for incoming frames. In System ON, if the energy detected at the antenna increases beyond a threshold value, the module will generate a FIELDDETECTED event. The module will generate a FIELDLOST event when the quality or strength of the field no longer support NFC communication. Please refer to [NFCT Electrical Specification](#) on page 436 for the Low Power Field Detect threshold values.

In system OFF, the NFC Low Power Field Detect function can wake the system up through a reset. The NFC bit in register [RESETREAS](#) on page 85 will be set as cause of the wake-up.

If the system is put into system OFF mode while a field is already present, the NFC Low Power Field Detect function will wake the system up right away and generate a reset.

Note that as a consequence of reset, NFC is disabled, so the reset handler will have to activate NFC again and set it up properly.

The HFXO must be running before the NFC peripheral goes into ACTIVATED state. Note that the NFC peripheral calibration is automatically done on ACTIVATE task. The HFXO can be turned off when the NFC peripheral goes into SENSE mode. The shortcut FIELDDETECTED\_ACTIVATE can be used when the HFXO is already running while in SENSE mode.

Outgoing data will be collected from RAM with the EasyDMA function and assembled according to the TXD.FRAMECONFIG register. Incoming data will be disassembled according to the RXD.FRAMECONFIG register and the data section in the frame will be written to RAM via the EasyDMA function.

The NFC peripheral includes a frame timing controller that can be used to accurately control the inter-frame delay between the incoming frame and a corresponding outgoing frame. It also includes optional CRC functionality.

The NFC peripheral has a set of different states. The module can change state by triggering a task, or when specific operations are finalized. Events and tasks allow software to keep track of and change the current state.

See [Figure 117: NFC block diagram](#) on page 417 and [Figure 118: NFC state diagram](#) on page 419 for more information.

#### Notes:

- FIELDLOST event will not be reflected in the state machine (for instance by going back to the DISABLE state), it is up to software to decide on the actions to take when a field lost occurs.
- FIELDLOST event is not generated in SENSE mode.
- FIELDDETECTED event is generated only on the transition from FIELDLOST event to energy detected by the NFC peripheral. So, sending SENSE task while field is still present does not generate FIELDDETECTED event.
- If the FIELDDETECTED event is cleared before sending the ACTIVATE task, then the FIELDDETECTED event shows up again after sending the ACTIVATE task. The shortcut FIELDDETECTED\_ACTIVATE can be used to avoid this condition.

Figure 118: NFC state diagram

## 42.2 Pin configuration

NFC uses two pins to connect the antenna.

These pins are shared with GPIOs, and the PROTECT field in the NFCPINS register in [UICR](#) defines the usage of these pins and their protection level against excessive voltages. The content of the NFCPINS register is reloaded at every reset.

When NFCPINS.PROTECT=NFC, a protection circuit will be enabled on the dedicated pins, preventing the chip from being damaged in the presence of a strong NFC field. The GPIO function will be disabled on those pins as well.

When NFCPINS.PROTECT=Disabled, the device will not be protected against strong NFC field damages caught by a connected NFC antenna, and the NFCT peripheral will not operate as expected, as it will never leave the DISABLE state.

The pins dedicated to the NFC antenna function will have some limitation when the pins are configured for normal GPIO operation. The pin capacitance will be higher on those (refer to  $C_{PAD\_NFC}$  in the [GPIO Electrical Specification](#) on page 154 below), and some increased leakage current between the two pins is to be expected if they are used in GPIO mode, and are driven to different logical values. To save power the two pins should always be set to the same logical value whenever entering one of the device power saving modes. Please refer to  $I_{NFC\_LEAK}$  in [GPIO Electrical Specification](#) on page 154 for details.

## 42.3 EasyDMA

The NFC peripheral implements EasyDMA for reading and writing of data packets from and to the Data RAM without CPU involvement.

The NFC EasyDMA utilizes one pointer called PACKETPTR for receiving and transmitting packets.

The EasyDMA can either read or write between the NFC peripheral and the RAM, but not at the same time. The event RXFRAMESTART indicates that the EasyDMA has started writing to the RAM for a receive frame and the event RXFRAMEEND indicates that the EasyDMA has completed writing to the RAM. Similarly, the event TXFRAMESTART indicates that the EasyDMA has started reading from the RAM for a transmit frame and the event TXFRAMEEND indicates that the EasyDMA has completed reading from the RAM. If a transmit and a receive operation is issued at the same time, the transmit operation would be prioritized.

Starting a transmit operation while the EasyDMA has already started writing a receive frame to the RAM will result in unpredictable behavior. Starting an EasyDMA operation whilst there is an ongoing EasyDMA operation may result in unpredictable behavior. It is recommended to wait for the TXFRAMEEND or

RXFRAMEND event for the respective ongoing transmit or receive before starting a new receive or transmit operation.

The MAXLEN register determines the maximum number of bytes that can be read from or written to the RAM. This feature can be used to secure that the NFC peripheral does not overwrite, or read beyond, the RAM assigned to a packet. Note that if the RXD.AMOUNT or TXD.AMOUNT register indicates longer data packets than set in MAXLEN, the frames sent to or received from the physical layer will be incomplete. In RX, the OVERRUN bit in the FRAMESTATUS.RX register will be set and an RXERROR event will be triggered in that situation.

Note that RXD.AMOUNT and TXD.AMOUNT define a frame length in bytes and bits excluding SoF, EoF and parity, but including CRC for RXD.AMOUNT only, make sure to take potential additional bits into account when setting MAXLEN.

Only sending task ENABLERXDATA ensures that a new value in PACKETPTR pointing to the RX buffer in Data RAM is taken into account.

If PACKETPTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See Chapter [Memory](#) on page 23 for more information about the different memory regions.

The NFC peripherals normally do alternative receive and transmit frames. So, to prepare for the next frame, the PACKETPTR, MAXLEN, TXD.FRAMECONFIG and TXD.AMOUNT can be updated while the receive is in progress, and, similarly, the PACKETPTR, MAXLEN and RXD.FRAMECONFIG can be updated while the transmit is in progress. They can be updated and prepared for the next NFC frame immediately after the STARTED event of the current frame has been received. Updating the TXD.FRAMECONFIG and TXD.AMOUNT during the current transmit frame or updating RXD.FRAMECONFIG during current receive frame may cause unpredictable behaviour.

In accordance with *NFC Forum, NFC Digital Protocol Technical Specification*, the least a significant bit from the least significant byte is sent on air first. The bytes are stored in increasing order, starting at the lowest address in the EasyDMA buffer in RAM.

## 42.4 Collision resolution

The NFC peripheral implements an automatic collision resolution function as defined by the NFC Forum.

The SENSRES and SELRES registers need to be programmed upfront in order for the collision resolution to behave correctly. Depending on the NFCIDSIZE field in SENSRES, the following registers also need to be programmed upfront:

- NFCID1\_LAST if NFCID1SIZE=NFCID1Single (ID = 4 bytes);
- NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Double (ID = 7 bytes);
- NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Triple (ID = 10 bytes);

[Table 98: NFCID1 byte allocation \(top sent first on air\)](#) on page 420 explains the position of the ID bytes in NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST and NFCID1\_LAST, depending on the ID size, and as compared to the definition used in the *NFC Forum, NFC Digital Protocol Technical Specification*.

**Table 98: NFCID1 byte allocation (top sent first on air)**

|          | ID = 4 bytes        | ID = 7 bytes        | ID = 10 bytes       |
|----------|---------------------|---------------------|---------------------|
| NFCID1_Q |                     |                     | nfcid1 <sub>0</sub> |
| NFCID1_R |                     |                     | nfcid1 <sub>1</sub> |
| NFCID1_S |                     |                     | nfcid1 <sub>2</sub> |
| NFCID1_T |                     | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> |
| NFCID1_U |                     | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> |
| NFCID1_V |                     | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> |
| NFCID1_W | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> | nfcid1 <sub>6</sub> |
| NFCID1_X | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> | nfcid1 <sub>7</sub> |
| NFCID1_Y | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> | nfcid1 <sub>8</sub> |
| NFCID1_Z | nfcid1 <sub>3</sub> | nfcid1 <sub>6</sub> | nfcid1 <sub>9</sub> |

Automatic collision resolution is enabled by default.

The hardware implementation can handle the states from IDLE to ACTIVE\_A automatically as defined in the *NFC Forum, NFC Activity Technical Specification*, and the other states are to be handled by software. The software keeps track of the state through events. The collision resolution will trigger an AUTOCOLRESSTARTED event when it has started. Reaching the ACTIVE\_A state is indicated by the SELECTED event.

If collision resolution fails, a COLLISION event is triggered. Note that errors occurring during automatic collision resolution may also cause ERROR and/or RXERROR events to be generated. Also, other events may get generated. It is recommended that the software ignores any event except COLLISION, SELECTED and FIELDLOST during automatic collision resolution. Software shall also make sure that any unwanted SHORT or PPI shortcut are disabled during automatic collision resolution.

A pre-defined set of registers, NFC.TAGHEADER0..3, containing a valid NFCID1 value, is available in [FICR](#), and can be used by software to populate the NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST and NFCID1\_LAST registers. Refer to the release notes of the NFC stack for more details on the format.

The automatic collision resolution will be restarted, if the packets are received with CRC or parity errors while in ACTIVE\_A state.

The SLP\_REQ is automatically handled by the NFC peripheral. However, this results in an ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS) since the SLP\_REQ has no response. This error must be ignored until the SELECTED event is triggered and this error should be cleared by the software when the SELECTED event is triggered.

## 42.5 Frame timing controller

The NFC peripheral includes a frame timing controller that continuously keeps track of the number of the 13.56 MHz RF-carrier clock periods since the end of the EoF of the last received frame.

The NFC peripheral can be programmed to send a responding frame within a time window or at an exact count of RF carrier periods. In case of FRAMEDELAYMODE = Window a STARTTX task triggered before the frame timing controller counter is equal to FRAMEDELAYMIN will force the transmission to halt until the counter is equal to FRAMEDELAYMIN. If the counter is within FRAMEDELAYMIN and FRAMEDELAYMAX when the STARTTX task is triggered, the peripheral will start the transmission straight away. In case of FRAMEDELAYMODE = ExactVal, a STARTTX task, triggered before the frame delay counter is equal to FRAMEDELAYMAX, will halt the actual transmission start until the counter is equal to FRAMEDELAYMAX.

In case of FRAMEDELAYMODE = WindowGrid, the behaviour is similar to the FRAMEDELAYMODE = Window, but the actual transmission between FRAMEDELAYMIN and FRAMEDELAYMAX starts on a bit grid as defined for NFC-A Listen frames (slot duration of 128 RF carrier periods).

The FRAMEDELAYMIN and FRAMEDELAYMAX values shall only be updated before the STARTTX task is triggered. Failing to do so may cause unpredictable behaviour. An ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS) will be asserted if the frame timing controller counter reaches FRAMEDELAYMAX without any STARTTX task triggered. This may happen even when the response is not required as per *NFC Forum, NFC Digital Protocol Technical Specification*. Any commands handled by the automatic collision resolution that don't involve a response being generated may also result in an ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS).

The frame timing controller operation is illustrated in [Figure 119: Frame timing controller \(FRAMEDELAYMODE=Window\)](#) on page 422. The frame timing controller automatically adjusts the frame timing counter based on the last received data bit according to NFC-A technology in the *NFC Forum, NFC Digital Protocol Technical Specification*.

**Figure 119: Frame timing controller (FRAMEDELAYMODE=Window)**

## 42.6 Frame assembler

The NFC peripheral implements a frame assembler in hardware.

When the NFC peripheral is in the ACTIVE\_A state, the software can decide to enter RX or TX mode. For RX, see [Frame disassembler](#) on page 423. For TX, the software must indicate the address of the source buffer in Data RAM and its size through programming the PACKETPTR and MAXCNT registers respectively, then issuing a TXSTART task.

MAXCNT must be set so that it matches the size of the frame to be sent.

The STARTED event indicates that the PACKETPTR and MAXCNT registers have been captured by the frame assembler's EasyDMA.

When asserting the STARTTX task, the frame assembler module will start reading TXD.AMOUNT.TXDATABYTES bytes (plus one additional byte if TXD.AMOUNT.TXDATABITS > 0) from the RAM position set by the PACKETPTR.

The NFC peripheral transmits the data as read from RAM, adding framing and the CRC calculated on the fly. The NFC peripheral will take  $(8 \times \text{TXD.AMOUNT.TXDATABYTES} + \text{TXD.AMOUNT.TXDATABITS})$  bits and assemble a frame according to settings in TXD.FRAMECONFIG. Both short frames, standard frames and bit oriented SDD frames as specified in the *NFC Forum, NFC Digital Protocol Technical Specification* can be assembled by correct setting of the TXD.FRAMECONFIG register.

The bytes will be transmitted on air in the same order as they are read from RAM with a rising bit order within each byte (least significant bit first). That is, b0 will be transmitted on air before b1, and so on. The bits read from RAM will be coded into symbols as defined in the *NFC Forum, NFC Digital Protocol Technical Specification*.

**Important:** Some NFC Forum documents, such as *NFC Forum, NFC Digital Protocol Technical Specification*, define bit numbering in a byte from b1 (LSB) to b8 (MSB), while most other technical documents from the NFC Forum, and also the Nordic Semiconductor documentation, traditionally numbers them from b0 to b7. The present document uses the b0 to b7 numbering scheme. Be aware of this when comparing with the *NFC Forum, NFC Digital Protocol Technical Specification* to others.

The frame assembler can be configured in TXD.FRAMECONFIG to add Start of Frame (SoF) symbol, calculate and add parity bits, and calculate and add CRC to the data read from RAM when assembling the frame. The total frame will then be longer than what is defined by TXD.AMOUNT.TXDATABYTES and TXDATABITS. DISCARDMODE will select if the first bits in the first byte read from RAM or the last bits in the last byte read from RAM will be discarded if TXD.AMOUNT.TXDATABITS are not equal to zero. Note that if TXD.FRAMECONFIG.PARITY = Parity and TXD.FRAMECONFIG.DISCARDMODE=DiscardStart, a parity bit will be included after the non-complete first byte. No parity will be added after a non-complete last byte.

The Frame Assemble operation is illustrated in [Figure 120: Frame assemble](#) on page 423 for different settings in TXD.FRAMECONFIG. All shaded bits fields are added by the frame assembler. Some of these bits are optional and appearances are configured in TXD.FRAMECONFIG. Please note that the frames illustrated do not necessarily comply with the NFC specification. The figure is only to illustrate the behavior of the NFC peripheral.

**Figure 120: Frame assemble**

The accurate timing for transmitting the frame on air is set using the frame timing controller settings.

## 42.7 Frame disassembler

The NFC peripheral implements a frame disassembler in hardware.

When the NFC peripheral is in the ACTIVE\_A state, the software can decide to enter RX or TX mode. For TX, see [Frame assembler](#) on page 422. For RX, the software must indicate the address of the destination buffer in Data RAM and its size through programming the PACKETPTR and MAXCNT registers respectively, then issuing a ENABLERXDATA task.

The STARTED event indicates that the PACKETPTR and MAXCNT registers have been captured by the frame disassembler's EasyDMA.

When an incoming frame starts, the RXFRAMESTART event will get issued and data will be written to the buffer in Data RAM. The frame disassembler will verify and remove on the fly any parity bits and SoF and End of Frame (EoF) symbols based on RXD.FRAMECONFIG register configuration. It will, however, verify and transfer the CRC bytes into RAM, if the CRC is was enabled through RXD.FRAMECONFIG.

When an EoF symbol is detected, the NFC peripheral will assert the RXFRAMEEND event and write the RXD.AMOUNT register to indicate numbers of received bytes and bits in the data packet. The module does not interpret the content of the data received from the remote NFC device, except for SoF, EoF, parity and CRC checking, as described above. The Frame disassemble operation is illustrated in [Figure 121: Frame disassemble illustration](#) on page 423.

Per NFC specification, the time between end of frame to the next start of frame can be as short as 86 µs, so care must be taken that PACKETPTR and MAXCNT are ready and ENABLERXDATA is issued on time after the end of previous frame. The use of a PPI shortcut from TXFRAMEEND to ENABLERXDATA is recommended.

**Figure 121: Frame disassemble illustration**

## 42.8 Antenna interface

In ACTIVATED state, an amplitude regulator will adjust the voltage swing on the antenna pins to a value that is within the  $V_{\text{swing}}$  limit.

Refer to [NFCT Electrical Specification](#) on page 436.

## 42.9 NFCT antenna recommendations

The NFCT antenna coil must be connected differential between **NFC1** and **NFC2** pins of the device.

Two external capacitors should be used to tune the resonance of the antenna circuit to 13.56 MHz.

**Figure 122: NFCT antenna recommendations**

The required tuning capacitor value is given by the below equations:

$$C'_{\text{tune}} = \frac{1}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{\text{ant}}} \quad \text{where } C'_{\text{tune}} = \frac{1}{2} \cdot (C_p + C_{\text{int}} + C_{\text{tune}})$$

$$\text{and } C_{\text{tune1}} = C_{\text{tune2}} = C_{\text{tune}} \quad C_{p1} = C_{p2} = C_p \quad C_{\text{int1}} = C_{\text{int2}} = C_{\text{int}}$$

$$C_{\text{tune}} = \frac{2}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{\text{ant}}} - C_p - C_{\text{int}}$$

An antenna inductance of  $L_{\text{ant}} = 2 \mu\text{H}$  will give tuning capacitors in the range of 130 pF on each pin. For good performance, match the total capacitance on **NFC1** and **NFC2**.

## 42.10 Battery protection

If the antenna is exposed to a strong NFC field, current may flow in the opposite direction on the supply due to parasitic diodes and ESD structures.

If the battery used does not tolerate return current, a series diode must be placed between the battery and the device in order to protect the battery.

 ## 42.13 Electrical specification

### 42.13.1 NFCT Electrical Specification

| Symbol            | Description                                                               | Min. | Typ.     | Max. | Units |
|-------------------|---------------------------------------------------------------------------|------|----------|------|-------|
| $f_c$             | Frequency of operation                                                    |      | 13.56    |      | MHz   |
| $C_{MI}$          | Carrier modulation index                                                  | 95   |          |      | %     |
| DR                | Data Rate                                                                 |      | 106      |      | kbps  |
| $f_s$             | Modulation sub-carrier frequency                                          |      | $f_c/16$ |      | MHz   |
| $V_{swing}$       | Peak differential Input voltage swing on NFC1 and NFC2                    |      |          | VDD  | Vp    |
| $V_{sense}$       | Peak differential Field detect threshold level on NFC1-NFC2 <sup>36</sup> | 1.0  |          |      | Vp    |
| $I_{sense}$       | Current in SENSE STATE                                                    |      | 100      |      | nA    |
| $I_{activated}$   | Current in ACTIVATED STATE                                                |      | 480      |      | μA    |
| $R_{in\_min}$     | Minimum input resistance when regulating voltage swing                    |      |          | 40   | Ω     |
| $R_{in\_max}$     | Maximum input resistance when regulating voltage swing                    | 1.0  |          |      | kΩ    |
| $R_{in\_loadmod}$ | Input resistance when load modulating                                     | 8    |          | 22   | Ω     |
| $I_{max}$         | Maximum input current on NFC pins                                         |      |          | 80   | mA    |

### 42.13.2 NFCT Timing Parameters

| Symbol         | Description                                                                                 | Min. | Typ. | Max. | Units |
|----------------|---------------------------------------------------------------------------------------------|------|------|------|-------|
| $t_{activate}$ | Time from task_ACTIVATE in SENSE or DISABLE state to ACTIVATE_A or IDLE state <sup>37</sup> |      |      | 500  | us    |
| $t_{sense}$    | Time from remote field is present in SENSE mode to FIELDDETECTED event is asserted          |      |      | 20   | us    |

Figure 123: NFCT timing parameters (Shortcuts for FIELDDETECTED and FIELDLOST are disabled)

<sup>36</sup> Input is high impedance in sense mode

<sup>37</sup> Does not account for voltage supply and oscillator startup times

## 43 PDM — Pulse density modulation interface

The pulse density modulation (PDM) module enables input of pulse density modulated signals from external audio frontends, for example, digital microphones. The PDM module generates the PDM clock and supports single-channel or dual-channel (Left and Right) data input. Data is transferred directly to RAM buffers using EasyDMA.

Listed here are the main features for PDM:

- Up to two PDM microphones configured as a Left/Right pair using the same data input
- 16 kHz output sample rate, 16-bit samples
- EasyDMA support for sample buffering
- HW decimation filters

The PDM module illustrated in [Figure 124: PDM module](#) on page 437 is interfacing up to two digital microphones with the PDM interface. It implements EasyDMA, which relieves real-time requirements associated with controlling the PDM slave from a low priority CPU execution context. It also includes all the necessary digital filter elements to produce PCM samples. The PDM module allows continuous audio streaming.

**Figure 124: PDM module**

### 43.1 Master clock generator

The FREQ field in the master clock's PDMCLKCTRL register allows adjusting the PDM clock's frequency.

The master clock generator does not add any jitter to the HFCLK source chosen. It is recommended (but not mandatory) to use the Xtal as HFCLK source.

### 43.2 Module operation

By default, bits from the left PDM microphone are sampled on PDM\_CLK falling edge, bits for the right are sampled on the rising edge of PDM\_CLK, resulting in two bitstreams. Each bitstream is fed into a digital filter which converts the PDM stream into 16-bit PCM samples, and filters and down-samples them to reach the appropriate sample rate.

The EDGE field in the MODE register allows swapping Left and Right, so that Left will be sampled on rising edge, and Right on falling.

The PDM module uses EasyDMA to store the samples coming out from the filters into one buffer in RAM.

Depending on the mode chosen in the OPERATION field in the MODE register, memory either contains alternating left and right 16-bit samples (Stereo), or only left 16-bit samples (Mono).

To ensure continuous PDM sampling, it is up to the application to update the EasyDMA destination address pointer as the previous buffer is filled.

The continuous transfer can be started or stopped by sending the START and STOP tasks. STOP becomes effective after the current frame has finished transferring, which will generate the STOPPED event. The STOPPED event indicates that all activity in the module are finished, and that the data is available in RAM (EasyDMA has finished transferring as well). Attempting to restart before receiving the STOPPED event may result in unpredictable behaviour.

### 43.3 Decimation filter

In order to convert the incoming data stream into PCM audio samples, a decimation filter is included in the PDM interface module.

The input of the filter is the two-channel PDM serial stream (with left channel on clock high, right channel on clock low), its output is  $2 \times 16$ -bit PCM samples at a sample rate 64 times lower than the PDM clock rate.

The filter stage of each channel is followed by a digital volume control, to attenuate or amplify the output samples in a range of -20 dB to +20 dB around the default (reset) setting, defined by  $G_{\text{PDM,default}}$ . The gain is controlled by the GAINL and GAINR registers.

As an example, if the goal is to achieve 2500 RMS output samples (16 bit) with a 1 kHz 90 dBA signal into a -26 dBFS sensitivity PDM microphone, the user will have to sum the PDM module's default gain ( $G_{\text{PDM,default}}$ ) and the gain introduced by the microphone and acoustic path of his implementation (an attenuation would translate into a negative gain), and adjust GAINL and GAINR by this amount. Assuming that only the PDM module influences the gain, GAINL and GAINR must be set to  $-G_{\text{PDM,default}}$  dB to achieve the requirement.

With  $G_{\text{PDM,default}}=3.2$  dB, and as GAINL and GAINR are expressed in 0.5 dB steps, the closest value to program would be 3.0 dB, which can be calculated as:

$$\text{GAINL} = \text{GAINR} = (\text{DefaultGain} - (2 * 3))$$

Remember to check that the resulting values programmed into GAINL and GAINR fall within MinGain and MaxGain.

### 43.4 EasyDMA

Samples will be written directly to RAM, and EasyDMA must be configured accordingly.

The address pointer for the EasyDMA channel is set in SAMPLE.PTR register. If the destination address set in SAMPLE.PTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 23 for more information about the different memory regions.

DMA supports Stereo (Left+Right 16-bit samples) and Mono (Left only) data transfer, depending on setting in the OPERATION field in the MODE register. The samples are stored little endian.

**Table 101: DMA sample storage**

| MODE.OPERATION | Bits per sample | Result stored per RAM word | Physical RAM allocated (32 bit words) | Result boundary indexes in RAM | Note    |
|----------------|-----------------|----------------------------|---------------------------------------|--------------------------------|---------|
| Stereo         | 32 (2x16)       | L+R                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | R0=[31:16]; L0=[15:0]          | Default |
| Mono           | 16              | 2xL                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | L1=[31:16]; L0=[15:0]          |         |

The destination buffer in RAM consists of one block, the size of which is set in SAMPLE.MAXCNT register. Format is number of 16-bit samples. The physical RAM allocated is always:

$$(\text{RAM allocation, in bytes}) = \text{SAMPLE.MAXCNT} * 2;$$

(but the mapping of the samples depends on MODE.OPERATION.

If OPERATION=Stereo, RAM will contain a succession of Left and Right samples.

If OPERATION=Mono, RAM will contain a succession of mono samples.

For a given value of `SAMPLE.MAXCNT`, the buffer in RAM can contain half the stereo sampling time as compared to the mono sampling time.

The PDM acquisition can be started by the `START` task, after the `SAMPLE.PTR` and `SAMPLE.MAXCNT` registers have been written. When starting the module, it will take some time for the filters to start outputting valid data. Transients from the PDM microphone itself may also occur. The first few samples (typically around 50) might hence contain invalid values or transients. It is therefore advised to discard the first few samples after a PDM start.

As soon as the `STARTED` event is received, the firmware can write the next `SAMPLE.PTR` value (this register is double-buffered), to ensure continuous operation.

When the buffer in RAM is filled with samples, an `END` event is triggered. The firmware can start processing the data in the buffer. Meanwhile, the PDM module starts acquiring data into the new buffer pointed to by `SAMPLE.PTR`, and sends a new `STARTED` event, so that the firmware can update `SAMPLE.PTR` to the next buffer address.

## 43.5 Hardware example

Connect the microphone clock to `CLK`, and data to `DIN`.

**Figure 125: Example of a single PDM microphone, wired as left**

**Figure 126: Example of a single PDM microphone, wired as right**

Note that in a single-microphone (mono) configuration, depending on the microphone's implementation, either the left or the right channel (sampled at falling or rising `CLK` edge respectively) will contain reliable data. If two microphones are used, one of them has to be set as left, the other as right (L/R pin tied high or to GND on the respective microphone). It is strongly recommended to use two microphones of exactly the same brand and type so that their timings in left and right operation match.

**Figure 127: Example of two PDM microphones**

## 43.6 Pin configuration

The `CLK` and `DIN` signals associated to the PDM module are mapped to physical pins according to the configuration specified in the `PSEL.CLK` and `PSEL.DIN` registers respectively. If the `CONNECT` field in any `PSEL` register is set to `Disconnected`, the associated PDM module signal will not be connected to the required physical pins, and will not operate properly.

The PSEL.CLK and PSEL.DIN registers and their configurations are only used as long as the PDM module is enabled, and retained only as long as the device is in System ON mode. See [POWER — Power supply](#) on page 78 for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To ensure correct behaviour in the PDM module, the pins used by the PDM module must be configured in the GPIO peripheral as described in [Table 102: GPIO configuration before enabling peripheral](#) on page 440 before enabling the PDM module. This is to ensure that the pins used by the PDM module are driven correctly if the PDM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the PDM module is supposed to be connected to an external PDM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behaviour.

**Table 102: GPIO configuration before enabling peripheral**

| PDM signal | PDM pin                  | Direction | Output value   | Comment |
|------------|--------------------------|-----------|----------------|---------|
| CLK        | As specified in PSEL.CLK | Output    | 0              |         |
| DIN        | As specified in PSEL.DIN | Input     | Not applicable |         |

## 43.7 Registers

**Table 103: Instances**

| Base address | Peripheral | Instance | Description                                             | Configuration |
|--------------|------------|----------|---------------------------------------------------------|---------------|
| 0x4001D000   | PDM        | PDM      | Pulse Density Modulation (Digital Microphone Interface) |               |

**Table 104: Register Overview**

| Register                      | Offset | Description                                                                                                                         |
|-------------------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_START                   | 0x000  | Starts continuous PDM transfer                                                                                                      |

 ## 43.8 Electrical specification

### 43.8.1 PDM Electrical Specification

| Symbol             | Description                                               | Min. | Typ.  | Max. | Units |
|--------------------|-----------------------------------------------------------|------|-------|------|-------|
| $I_{PDM, stereo}$  | PDM module active current, stereo operation <sup>38</sup> |      | 1.4   |      | mA    |
| $f_{PDM, CLK}$     | PDM clock speed                                           |      | 1.032 |      | MHz   |
| $t_{PDM, JITTER}$  | Jitter in PDM clock output                                |      |       | 20   | ns    |
| $T_{dPDM, CLK}$    | PDM clock duty cycle                                      | 40   | 50    | 60   | %     |
| $t_{PDM, DATA}$    | Decimation filter delay                                   |      |       | 5    | ms    |
| $t_{PDM, cv}$      | Allowed clock edge to data valid                          |      |       | 125  | ns    |
| $t_{PDM, ci}$      | Allowed (other) clock edge to data invalid                | 0    |       |      | ns    |
| $t_{PDM, s}$       | Data setup time at $f_{PDM, CLK}=1.024$ MHz               | 65   |       |      | ns    |
| $t_{PDM, h}$       | Data hold time at $f_{PDM, CLK}=1.024$ MHz                | 0    |       |      | ns    |
| $G_{PDM, default}$ | Default (reset) absolute gain of the PDM module           |      | 3.2   |      | dB    |

<sup>38</sup> Average current including PDM and DMA transfers, excluding clock and power supply base currents

Figure 128: PDM timing diagram

## 44 I<sup>2</sup>S — Inter-IC sound interface

The I<sup>2</sup>S (Inter-IC Sound) module, supports the original two-channel I<sup>2</sup>S format, and left or right-aligned formats. It implements EasyDMA for sample transfer directly to and from RAM without CPU intervention.

The I<sup>2</sup>S peripheral has the following main features:

- Master and Slave mode
- Simultaneous bi-directional (TX and RX) audio streaming
- Original I<sup>2</sup>S and left- or right-aligned format
- 8, 16 and 24-bit sample width
- Low-jitter Master Clock generator
- Various sample rates

Figure 129: I<sup>2</sup>S master

### 44.1 Mode

The I<sup>2</sup>S protocol specification defines two modes of operation, Master and Slave.

The I<sup>2</sup>S mode decides which of the two sides (Master or Slave) shall provide the clock signals LRCK and SCK, and these signals are always supplied by the Master to the Slave.

### 44.2 Transmitting and receiving

The I<sup>2</sup>S module supports both transmission (TX) and reception (RX) of serial data. In both cases the serial data is shifted synchronously to the clock signals SCK and LRCK.

TX data is written to the SDOUT pin on the falling edge of SCK, and RX data is read from the SDIN pin on the rising edge of SCK. The most significant bit (MSB) is always transmitted first.

TX and RX are available in both Master and Slave modes and can be enabled/disabled independently in the [CONFIG.TXEN](#) on page 456 and [CONFIG.RXEN](#) on page 456.

Transmission and/or reception is started by triggering the START task. When started and transmission is enabled (in [CONFIG.TXEN](#) on page 456), the TXPTRUPD event will be generated for every [RXTXD.MAXCNT](#) on page 459 number of transmitted data words (containing one or more samples). Similarly, when started and reception is enabled (in [CONFIG.RXEN](#) on page 456), the RXPTRUPD event will be generated for every [RXTXD.MAXCNT](#) on page 459 received data words.

**Figure 130: Transmitting and receiving. CONFIG.FORMAT = Aligned, CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo, RXTXD.MAXCNT = 1.**

### 44.3 Left right clock (LRCK)

The Left Right Clock (LRCK), often referred to as "word clock", "sample clock" or "word select" in I<sup>2</sup>S context, is the clock defining the frames in the serial bit streams sent and received on SDOUT and SDIN, respectively.

In I2S mode, each frame contains one left and right sample pair, with the left sample being transferred during the low half period of LRCK followed by the right sample being transferred during the high period of LRCK.

In Aligned mode, each frame contains one left and right sample pair, with the left sample being transferred during the high half period of LRCK followed by the right sample being transferred during the low period of LRCK.

Consequently, the LRCK frequency is equivalent to the audio sample rate.

When operating in Master mode, the LRCK is generated from the MCK, and the frequency of LRCK is then given as:

$$\text{LRCK} = \text{MCK} / \text{CONFIG.RATIO}$$

LRCK always toggles around the falling edge of the serial clock SCK.

### 44.4 Serial clock (SCK)

The serial clock (SCK), often referred to as the serial bit clock, pulses once for each data bit being transferred on the serial data lines SDIN and SDOUT.

When operating in Master mode the SCK is generated from the MCK, and the frequency of SCK is then given as:

$$SCK = 2 * LRCK * CONFIG.SWIDTH$$

The falling edge of the SCK falls on the toggling edge of LRCK.

When operating in Slave mode SCK is provided by the external I<sup>2</sup>S master.

## 44.5 Master clock (MCK)

The master clock (MCK) is the clock from which LRCK and SCK are derived when operating in Master mode.

The MCK is generated by an internal MCK generator. This generator always needs to be enabled when in Master mode, but the generator can also be enabled when in Slave mode. Enabling the generator when in slave mode can be useful in the case where the external Master is not able to generate its own master clock.

The MCK generator is enabled/disabled in the register [CONFIG.MCKEN](#) on page 457, and the generator is started or stopped by the START or STOP tasks.

In Master mode the LRCK and the SCK frequencies are closely related, as both are derived from MCK and set indirectly through [CONFIG.RATIO](#) on page 457 and [CONFIG.SWIDTH](#) on page 458.

When configuring these registers, the user is responsible for fulfilling the following requirements:

1. SCK frequency can never exceed the MCK frequency, which can be formulated as:

$$CONFIG.RATIO \geq 2 * CONFIG.SWIDTH$$

2. The MCK/LRCK ratio shall be a multiple of  $2 * CONFIG.SWIDTH$ , which can be formulated as:

$$Integer = (CONFIG.RATIO / (2 * CONFIG.SWIDTH))$$

The MCK signal can be routed to an output pin (specified in PSEL.MCK) to supply external I<sup>2</sup>S devices that require the MCK to be supplied from the outside.

When operating in Slave mode, the I<sup>2</sup>S module does not use the MCK and the MCK generator does not need to be enabled.

**Figure 131: Relation between RATIO, MCK and LRCK.**

**Table 105: Configuration examples**

| Desired LRCK [Hz] | CONFIG.SWIDTH | CONFIG.RATIO | CONFIG.MCKFREQ | MCK [Hz]   | LRCK [Hz] | LRCK error [%] |
|-------------------|---------------|--------------|----------------|------------|-----------|----------------|
| 16000             | 16Bit         | 32X          | 32MDIV63       | 507936.5   | 15873.0   | -0.8           |

## 44.6 Width, alignment and format

The CONFIG.SWIDTH register primarily defines the sample width of the data written to memory. In master mode, it then also sets the amount of bits per frame. In Slave mode it controls padding/trimming if required. Left, right, transmitted, and received samples always have the same width. The CONFIG.FORMAT register specifies the position of the data frames with respect to the LRCK edges in both Master and Slave modes.

When using I<sup>2</sup>S format, the first bit in a half-frame (containing one left or right sample) gets sampled on the second rising edge of the SCK after a LRCK edge. When using Aligned mode, the first bit in a half-frame gets sampled on the first rising edge of SCK following a LRCK edge.

For data being received on SDIN the sample value can be either right or left-aligned inside a half-frame, as specified in [CONFIG.ALIGN](#) on page 458. [CONFIG.ALIGN](#) on page 458 affects only the decoding of the incoming samples (SDIN), while the outgoing samples (SDOUT) are always left-aligned (or justified).

When using left-alignment, each half-frame starts with the MSB of the sample value (both for data being sent on SDOUT and received on SDIN).

When using right-alignment, each half-frame of data being received on SDIN ends with the LSB of the sample value, while each half-frame of data being sent on SDOUT starts with the MSB of the sample value (same as for left-alignment).

In Master mode, the size of a half-frame (in number of SCK periods) equals the sample width (in number of bits), and in this case the alignment setting does not care as each half-frame in any case will start with the MSB and end with the LSB of the sample value.

In slave mode, however, the sample width does not need to equal the frame size. This means you might have extra or fewer SCK pulses per half-frame than what the sample width specified in [CONFIG.SWIDTH](#) requires.

In the case where we use **left-alignment** and the number of SCK pulses per half-frame is **higher** than the sample width, the following will apply:

- For data received on SDIN, all bits after the LSB of the sample value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the sample value will be 0.

In the case where we use **left-alignment** and the number of SCK pulses per frame is **lower** than the sample width, the following will apply:

- Data sent and received on SDOUT and SDIN will be truncated with the LSBs being removed first.

In the case where we use **right-alignment** and the number of SCK pulses per frame is **higher** than the sample width, the following will apply:

- For data received on SDIN, all bits before the MSB of the sample value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the sample value will be 0 (same behavior as for left-alignment).

In the case where we use **right-alignment** and the number of SCK pulses per frame is **lower** than the sample width, the following will apply:

- Data received on SDIN will be sign-extended to "sample width" number of bits before being written to memory.
- Data sent on SDOUT will be truncated with the LSBs being removed first (same behavior as for left-alignment).

**Figure 132: I<sup>2</sup>S format. CONFIG.SWIDTH equalling half-frame size.**

**Figure 133: Aligned format. CONFIG.SWIDTH equalling half-frame size.**

## 44.7 EasyDMA

The I<sup>2</sup>S module implements EasyDMA for accessing internal Data RAM without CPU intervention.

The source and destination pointers for the TX and RX data are configured in [TXD.PTR](#) on page 459 and [RXD.PTR](#) on page 459. The memory pointed to by these pointers will only be read or written when TX or RX are enabled in [CONFIG.TXEN](#) on page 456 and [CONFIG.RXEN](#) on page 456.

The addresses written to the pointer registers [TXD.PTR](#) on page 459 and [RXD.PTR](#) on page 459 are double-buffered in hardware, and these double buffers are updated for every [RXTXD.MAXCNT](#) on page 459 words (containing one or more samples) read/written from/to memory. The events TXPTRUPD and RXPTRUPD are generated whenever the TXD.PTR and RXD.PTR are transferred to these double buffers.

If [TXD.PTR](#) on page 459 is not pointing to the Data RAM region when transmission is enabled, or [RXD.PTR](#) on page 459 is not pointing to the Data RAM region when reception is enabled, an EasyDMA transfer may result in a HardFault and/or memory corruption. See [Memory](#) on page 23 for more information about the different memory regions.

Due to the nature of I<sup>2</sup>S, where the number of transmitted samples always equals the number of received samples (at least when both TX and RX are enabled), one common register [RXTXD.MAXCNT](#) on page 459 is used for specifying the sizes of these two memory buffers. The size of the buffers is specified in a number of 32-bit words. Such a 32-bit memory word can either contain four 8-bit samples, two 16-bit samples or one right-aligned 24-bit sample sign extended to 32 bit.

In stereo mode (CONFIG.CHANNELS=Stereo), the samples are stored as "left and right sample pairs" in memory. Figure [Figure 134: Memory mapping for 8 bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.](#) on page 450, [Figure 136: Memory mapping for 16 bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.](#) on page 451 and [Figure 138: Memory mapping for 24 bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.](#) on page 451 show how the samples are mapped to memory in this mode. The mapping is valid for both RX and TX.

In mono mode (CONFIG.CHANNELS=Left or Right), RX sample from only one channel in the frame is stored in memory, the other channel sample is ignored. Illustrations [Figure 135: Memory mapping for 8 bit mono. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.](#) on page 451, [Figure 137: Memory mapping for 16 bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.](#) on page 451 and [Figure 139: Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.](#) on page 452 show how RX samples are mapped to memory in this mode.

For TX, the same outgoing sample read from memory is transmitted on both left and right in a frame, resulting in a mono output stream.

**Figure 134: Memory mapping for 8 bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.**

**Figure 135: Memory mapping for 8 bit mono. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.**

**Figure 136: Memory mapping for 16 bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.**

**Figure 137: Memory mapping for 16 bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.**

**Figure 138: Memory mapping for 24 bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.**

**Figure 139: Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.**

## 44.8 Module operation

Described here is a typical operating procedure for the I<sup>2</sup>S module.

### 1. Configure the I<sup>2</sup>S module using the CONFIG registers

```
// Enable reception
NRF_I2S->CONFIG.RXEN = (I2S_CONFIG_RXEN_RXEN_Enabled <<
                        I2S_CONFIG_RXEN_RXEN_Pos);

// Enable transmission
NRF_I2S->CONFIG.TXEN = (I2S_CONFIG_TXEN_TXEN_Enabled <<
                        I2S_CONFIG_TXEN_TXEN_Pos);

// Enable MCK generator
NRF_I2S->CONFIG.MCKEN = (I2S_CONFIG_MCKEN_MCKEN_Enabled <<
                        I2S_CONFIG_MCKEN_MCKEN_Pos);

// MCKFREQ = 4 MHz
NRF_I2S->CONFIG.MCKFREQ = I2S_CONFIG_MCKFREQ_MCKFREQ_32MDIV8 <<
                        I2S_CONFIG_MCKFREQ_MCKFREQ_Pos;

// Ratio = 256
NRF_I2S->CONFIG.RATIO = I2S_CONFIG_RATIO_RATIO_256X <<
                        I2S_CONFIG_RATIO_RATIO_Pos;

// MCKFREQ = 4 MHz and Ratio = 256 gives sample rate = 15.625 ks/s
// Sample width = 16 bit
NRF_I2S->CONFIG.SWIDTH = I2S_CONFIG_SWIDTH_SWIDTH_16Bit <<
                        I2S_CONFIG_SWIDTH_SWIDTH_Pos;

// Alignment = Left
NRF_I2S->CONFIG.ALIGN = I2S_CONFIG_ALIGN_ALIGN_Left <<
                        I2S_CONFIG_ALIGN_ALIGN_Pos;

// Format = I2S
NRF_I2S->CONFIG.FORMAT = I2S_CONFIG_FORMAT_FORMAT_I2S <<
                        I2S_CONFIG_FORMAT_FORMAT_Pos;

// Use stereo
NRF_I2S->CONFIG.CHANNELS = I2S_CONFIG_CHANNELS_CHANNELS_Stereo <<
                        I2S_CONFIG_CHANNELS_CHANNELS_Pos;
```

### 2. Map IO pins using the PINSEL registers

```
// MCK routed to pin 0
NRF_I2S->PSEL.MCK = (0 << I2S_PSEL_MCK_PIN_Pos) |
                    (I2S_PSEL_MCK_CONNECT_Connected <<
                     I2S_PSEL_MCK_CONNECT_Pos);

// SCK routed to pin 1
NRF_I2S->PSEL.SCK = (1 << I2S_PSEL_SCK_PIN_Pos) |
                    (I2S_PSEL_SCK_CONNECT_Connected <<
                     I2S_PSEL_SCK_CONNECT_Pos);

// LRCK routed to pin 2
NRF_I2S->PSEL.LRCK = (2 << I2S_PSEL_LRCK_PIN_Pos) |
                    (I2S_PSEL_LRCK_CONNECT_Connected <<
```

```

    I2S_PSEL_LRCK_CONNECT_Pos);
// SDOUT routed to pin 3
NRF_I2S->PSEL.SDOUT = (3 << I2S_PSEL_SDOUT_PIN_Pos) |
                      (I2S_PSEL_SDOUT_CONNECT_Connected <<

    I2S_PSEL_SDOUT_CONNECT_Pos);
// SDIN routed on pin 4
NRF_I2S->PSEL.SDIN = (4 << I2S_PSEL_SDIN_PIN_Pos) |
                    (I2S_PSEL_SDIN_CONNECT_Connected <<

    I2S_PSEL_SDIN_CONNECT_Pos);

```

### 3. Configure TX and RX data pointers using the TXD, RXD and RXTXD registers

```

NRF_I2S->TXD.PTR = my_tx_buf;
NRF_I2S->RXD.PTR = my_rx_buf;
NRF_I2S->TXD.MAXCNT = MY_BUF_SIZE;

```

### 4. Enable the I<sup>2</sup>S module using the ENABLE register

```

NRF_I2S->ENABLE = 1;

```

### 5. Start audio streaming using the START task

```

NRF_I2S->TASKS_START = 1;

```

### 6. Handle received and transmitted data when receiving the TXPTRUPD and RXPTRUPD events

```

if(NRF_I2S->EVENTS_TXPTRUPD != 0)
{
    NRF_I2S->TXD.PTR = my_next_tx_buf;
    NRF_I2S->EVENTS_TXPTRUPD = 0;
}

if(NRF_I2S->EVENTS_RXPTRUPD != 0)
{
    NRF_I2S->RXD.PTR = my_next_rx_buf;
    NRF_I2S->EVENTS_RXPTRUPD = 0;
}

```

## 44.9 Pin configuration

The MCK, SCK, LRCK, SDIN and SDOUT signals associated with the I<sup>2</sup>S module are mapped to physical pins according to the pin numbers specified in the PSEL.x registers.

These pins are acquired whenever the I<sup>2</sup>S module is enabled through the register [ENABLE](#) on page 456.

When a pin is acquired by the I<sup>2</sup>S module, the direction of the pin (input or output) will be configured automatically, and any pin direction setting done in the GPIO module will be overridden. The directions for the various I<sup>2</sup>S pins are shown below in [Table 106: GPIO configuration before enabling peripheral \(master mode\)](#) on page 453 and [Table 107: GPIO configuration before enabling peripheral \(slave mode\)](#) on page 454.

To secure correct signal levels on the pins when the system is in OFF mode, and when the I<sup>2</sup>S module is disabled, these pins must be configured in the GPIO peripheral directly.

**Table 106: GPIO configuration before enabling peripheral (master mode)**

| I <sup>2</sup> S signal | I <sup>2</sup> S pin      | Direction | Output value | Comment |
|-------------------------|---------------------------|-----------|--------------|---------|
| MCK                     | As specified in PSEL.MCK  | Output    | 0            |         |
| LRCK                    | As specified in PSEL.LRCK | Output    | 0            |         |

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| SCK                     | As specified in PSEL.SCK   | Output    | 0              |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

**Table 107: GPIO configuration before enabling peripheral (slave mode)**

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Input     | Not applicable |         |
| SCK                     | As specified in PSEL.SCK   | Input     | Not applicable |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

## 44.10 Registers

**Table 108: Instances**

| Base address | Peripheral | Instance | Description              | Configuration |
|--------------|------------|----------|--------------------------|---------------|
| 0x40025000   | I2S        | I2S      | Inter-IC Sound Interface |               |

**Table 109: Register Overview**

| Register               | Offset | Description                                                                                                                                                                                                     |
|------------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_START            | 0x000  | Starts continuous I2S transfer. Also starts MCK generator when this is enabled.                                                                                                                                 |
| TASKS_STOP             | 0x004  | Stops I2S transfer. Also stops MCK generator. Triggering this task will cause the {event:STOPPED} event to be generated.                                                                                        |
| EVENTS_RXPTRUPD        | 0x104  | The RXD.PTR register has been copied to internal double-buffers. When the I2S module is started and RX is enabled, this event will be generated for every RXTXD.MAXCNT words that are received on the SDIN pin. |
| EVENTS_STOPPED         | 0x108  | I2S transfer stopped.                                                                                                                                                                                           |
| EVENTS_TXPTRUPD        | 0x114  | The TDX.PTR register has been copied to internal double-buffers. When the I2S module is started and TX is enabled, this event will be generated for every RXTXD.MAXCNT words that are sent on the SDOUT pin.    |
| <i>INTEN</i>           | 0x300  | Enable or disable interrupt                                                                                                                                                                                     |
| <i>INTENSET</i>        | 0x304  | Enable interrupt                                                                                                                                                                                                |
| <i>INTENCLR</i>        | 0x308  | Disable interrupt                                                                                                                                                                                               |
| <i>ENABLE</i>          | 0x500  | Enable I2S module.                                                                                                                                                                                              |
| <i>CONFIG.MODE</i>     | 0x504  | I2S mode.                                                                                                                                                                                                       |
| <i>CONFIG.RXEN</i>     | 0x508  | Reception (RX) enable.                                                                                                                                                                                          |
| <i>CONFIG.TXEN</i>     | 0x50C  | Transmission (TX) enable.                                                                                                                                                                                       |
| <i>CONFIG.MCKEN</i>    | 0x510  | Master clock generator enable.                                                                                                                                                                                  |
| <i>CONFIG.MCKFREQ</i>  | 0x514  | Master clock generator frequency.                                                                                                                                                                               |
| <i>CONFIG.RATIO</i>    | 0x518  | MCK / LRCK ratio.                                                                                                                                                                                               |
| <i>CONFIG.SWIDTH</i>   | 0x51C  | Sample width.                                                                                                                                                                                                   |
| <i>CONFIG.ALIGN</i>    | 0x520  | Alignment of sample within a frame.                                                                                                                                                                             |
| <i>CONFIG.FORMAT</i>   | 0x524  | Frame format.                                                                                                                                                                                                   |
| <i>CONFIG.CHANNELS</i> | 0x528  | Enable channels.                                                                                                                                                                                                |
| <i>RXD.PTR</i>         | 0x538  | Receive buffer RAM start address.                                                                                                                                                                               |
| <i>TXD.PTR</i>         | 0x540  | Transmit buffer RAM start address.                                                                                                                                                                              |
| <i>RXTXD.MAXCNT</i>    | 0x550  | Size of RXD and TXD buffers.                                                                                                                                                                                    |

  ## 44.11 Electrical specification

### 44.11.1 I2S timing specification

| Symbol          | Description                        | Min. | Typ. | Max. | Units |
|-----------------|------------------------------------|------|------|------|-------|
| $t_{S\_SDIN}$   | SDIN setup time before SCK rising  | 20   |      |      | ns    |
| $t_{H\_SDIN}$   | SDIN hold time after SCK rising    | 15   |      |      | ns    |
| $t_{S\_SDOUT}$  | SDOUT setup time after SCK falling | 40   |      |      | ns    |
| $t_{H\_SDOUT}$  | SDOUT hold time before SCK falling | 6    |      |      | ns    |
| $t_{SCK\_LRCK}$ | SCLK falling to LRCK edge          | -5   | 0    | 5    | ns    |
| $f_{MCK}$       | MCK frequency                      |      |      | 4000 | kHz   |
| $f_{LRCK}$      | LRCK frequency                     |      |      | 48   | kHz   |
| $f_{SCK}$       | SCK frequency                      |      |      | 2000 | kHz   |
| $DC_{CK}$       | Clock duty cycle (MCK, LRCK, SCK)  | 45   |      | 55   | %     |

Figure 140: I2S timing diagram

## 45 MWU — Memory watch unit

The Memory watch unit (MWU) can be used to generate events when a memory region is accessed by the CPU. The MWU can be configured to trigger events for access to Data RAM and Peripheral memory segments. The MWU allows an application developer to generate memory access events during development for debugging or during production execution for failure detection and recovery.

Listed here are the main features for MWU:

- Six memory regions, four user-configurable and two fixed regions in peripheral address space
- Flexible configuration of regions with START and END addresses
- Generate events on CPU read and/or write to a defined region of Data RAM or peripheral memory address space
- Programmable maskable or non-maskable (NMI) interrupt on events
- Peripheral interfaces can be watched for read and write access using subregions of the two fixed memory regions

**Table 110: Memory regions**

| Memory region | START address | END address  |
|---------------|---------------|--------------|
| REGION[0..3]  | Configurable  | Configurable |
| PREGION[0]    | 0x40000000    | 0x4001FFFF   |
| PREGION[1]    | 0x40020000    | 0x4003FFFF   |

Each MWU region is defined by a start address and an end address, configured by the START and END registers respectively. These addresses are byte aligned and inclusive. The END register value has to be greater or equal to the START register value. Each region is associated with a pair of events that indicate that either a write access or a read access from the CPU has been detected inside the region.

For regions containing subregions (see below), a set of status registers PERREGION[0..1].SUBSTATWA and PERREGION[0..1].SUBSTATRA indicate which subregion(s) caused the EVENT\_PREGION[0..1].WA and EVENT\_PREGION[0..1].RA respectively.

The MWU is only able to detect memory accesses in the Data RAM and Peripheral memory segments from the CPU, see [Memory](#) on page 23 for more information about the different memory segments. EasyDMA accesses are not monitored by the MWU. The MWU requires two HCLK cycles to detect and generate the event.

The peripheral regions, PREGION[0..1], are divided into 32 equally sized subregions, SR[0..31]. All subregions are excluded in the main region by default, and any can be included by specifying them in the SUBS register. When a subregion is excluded from the main region, the memory watch mechanism will not trigger any events when that subregion is accessed.

Subregions in PREGION[0..1] cannot be individually configured for read or write access watch. Watch configuration is only possible for a region as a whole. The PRGNiRA and PRGNiWA (i=0..1) fields in the REGIONEN register control watching read and write access.

REGION[0..3] can be individually enabled for read and/or write access watching through their respective RGNiRA and RGNiWA (i=0..3) fields in the REGIONEN register.

REGIONENSET and REGIONENCLR allow respectively enabling and disabling one or multiple REGIONs or PREGIONs watching in a single write access.

### 45.1 Registers

**Table 111: Instances**

| Base address | Peripheral | Instance | Description       | Configuration |
|--------------|------------|----------|-------------------|---------------|
| 0x40020000   | MWU        | MWU      | Memory Watch Unit |               |

**Table 112: Register Overview**

| Register             | Offset | Description                                                                                                         |
|----------------------|--------|---------------------------------------------------------------------------------------------------------------------|
| EVENTS_REGION[0].WA  | 0x100  | Write access to region 0 detected                                                                                   |
| EVENTS_REGION[0].RA  | 0x104  | Read access to region 0 detected                                                                                    |
| EVENTS_REGION[1].WA  | 0x108  | Write access to region 1 detected                                                                                   |
| EVENTS_REGION[1].RA  | 0x10C  | Read access to region 1 detected                                                                                    |
| EVENTS_REGION[2].WA  | 0x110  | Write access to region 2 detected                                                                                   |
| EVENTS_REGION[2].RA  | 0x114  | Read access to region 2 detected                                                                                    |
| EVENTS_REGION[3].WA  | 0x118  | Write access to region 3 detected                                                                                   |
| EVENTS_REGION[3].RA  | 0x11C  | Read access to region 3 detected                                                                                    |
| EVENTS_PREGION[0].WA | 0x160  | Write access to peripheral region 0 detected                                                                        |
| EVENTS_PREGION[0].RA | 0x164  | Read access to peripheral region 0 detected                                                                         |
| EVENTS_PREGION[1].WA | 0x168  | Write access to peripheral region 1 detected                                                                        |
| EVENTS_PREGION[1].RA | 0x16C  | Read access to peripheral region 1 detected                                                                         |

## 46 EGU — Event generator unit

The Event generator unit (EGU) provides support for inter-layer signaling. This means support for atomic triggering of both CPU execution and hardware tasks from both firmware (by CPU) and hardware (by PPI). This feature can, for instance, be used for triggering CPU execution at a lower priority execution from a higher priority execution, or to handle a peripheral's ISR execution at a lower priority for some of its events. However, triggering any priority from any priority is possible.

Listed here are the main EGU features:

- Enables SW triggering of interrupts
- 6 EGU instances – separate interrupt vectors
- Up to 16 separate event flags per interrupt for multiplexing

The EGU implements a set of tasks which can individually be triggered to generate the corresponding event, i.e., the corresponding event for TASKS\_TRIGGER[n] is EVENTS\_TRIGGERED[n].

**Table 113: EGU configuration**

| EGU instance | Number of event flags |
|--------------|-----------------------|
| 0-5          | 16                    |

### 46.1 Registers

**Table 114: Instances**

| Base address | Peripheral | Instance | Description            | Configuration |
|--------------|------------|----------|------------------------|---------------|
| 0x40014000   | EGU        | EGU0     | Event Generator Unit 0 |               |
| 0x40015000   | EGU        | EGU1     | Event Generator Unit 1 |               |
| 0x40016000   | EGU        | EGU2     | Event Generator Unit 2 |               |
| 0x40017000   | EGU        | EGU3     | Event Generator Unit 3 |               |
| 0x40018000   | EGU        | EGU4     | Event Generator Unit 4 |               |
| 0x40019000   | EGU        | EGU5     | Event Generator Unit 5 |               |

**Table 115: Register Overview**

| Register            | Offset | Description                                                              |
|---------------------|--------|--------------------------------------------------------------------------|
| TASKS_TRIGGER[0]    | 0x000  | Trigger 0 for triggering the corresponding TRIGGERED[0] event            |
| TASKS_TRIGGER[1]    | 0x004  | Trigger 1 for triggering the corresponding TRIGGERED[1] event            |
| TASKS_TRIGGER[2]    | 0x008  | Trigger 2 for triggering the corresponding TRIGGERED[2] event            |
| TASKS_TRIGGER[3]    | 0x00C  | Trigger 3 for triggering the corresponding TRIGGERED[3] event            |
| TASKS_TRIGGER[4]    | 0x010  | Trigger 4 for triggering the corresponding TRIGGERED[4] event            |
| TASKS_TRIGGER[5]    | 0x014  | Trigger 5 for triggering the corresponding TRIGGERED[5] event            |
| TASKS_TRIGGER[6]    | 0x018  | Trigger 6 for triggering the corresponding TRIGGERED[6] event            |

## 47 PWM — Pulse width modulation

The PWM module enables the generation of pulse width modulated signals on GPIO. The module implements an up or up-and-down counter with four PWM channels that drive assigned GPIOs.

Three PWM modules can provide up to 12 PWM channels with individual frequency control in groups of up to four channels. Furthermore, a built-in decoder and EasyDMA capabilities make it possible to manipulate the PWM duty cycles without CPU intervention. Arbitrary duty-cycle sequences are read from Data RAM and can be chained to implement ping-pong buffering or repeated into complex loops.

Listed here are the main features of one PWM module:

- Fixed PWM base frequency with programmable clock divider
- Up to four PWM channels with individual polarity and duty-cycle values
- Edge or center-aligned pulses across PWM channels
- Multiple duty-cycle arrays (sequences) defined in Data RAM
- Autonomous and glitch-free update of duty cycle values directly from memory through EasyDMA
- Change of polarity, duty-cycle, and base frequency possibly on every PWM period
- Data RAM sequences can be repeated or connected into loops

**Figure 141: PWM Module**

### 47.1 Wave counter

The wave counter is responsible for generating the pulses at a duty-cycle that depends on the compare values, and at a frequency that depends on COUNTERTOP.

There is one common 15-bit counter with four compare channels. Thus, all four channels will share the same period (PWM frequency), but can have individual duty-cycle and polarity. The polarity is set by the value read from RAM (see [Figure 144: Decoder memory access modes](#) on page 499), while the MODE register controls if the counter counts up, or up and down. The timer top value is controlled by the COUNTERTOP register. This register value in conjunction with the selected PRESCALER of the PWM\_CLK will result in a given PWM period. A COUNTERTOP value smaller than the compare setting will result in a state where no PWM edges are generated. Respectively, OUT[n] is held high, given that the polarity is set to FallingEdge. All the compare registers are internal and can only be configured through the decoder presented later.

COUNTERTOP can be safely written at any time. It will get sampled following a START task. If DECODER.LOAD is anything else than WaveForm, it will also get sampled following a STARTSEQ[n] task,

and when loading a new value from RAM during a sequence playback. If `DECODER.LOAD=WaveForm`, the register value is ignored, and taken from RAM instead (see [Decoder with EasyDMA](#) on page 499 below).

**Figure 142: PWM up counter example - FallingEdge polarity** on page 497 shows the counter operating in up (MODE=PWM\_MODE\_Up) mode with three PWM channels with the same frequency but different duty cycle. The counter is automatically reset to zero when COUNTERTOP is reached and `OUT[n]` will invert. `OUT[n]` is held low if the compare value is 0 and held high respectively if set to COUNTERTOP given that the polarity is set to FallingEdge. Running in up counter mode will result in pulse widths that are edge-aligned. See the code example below:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY,
  PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
  (PWM_PSEL_OUT_CONNECT_Connected <<
    PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
  (PWM_PSEL_OUT_CONNECT_Connected <<
    PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
  PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
  (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
  PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

**Figure 142: PWM up counter example - FallingEdge polarity**

In up counting mode, the following formula can be used to compute PWM period and step size:

PWM period:  $T_{PWM(Up)} = T_{PWM\_CLK} * COUNTERTOP$

Step width/Resolution:  $T_{steps} = T_{PWM\_CLK}$

*Figure 143: PWM up-and-down counter example* on page 498 shows the counter operating in up and down mode with (MODE=PWM\_MODE\_UpAndDown) two PWM channels with the same frequency but different duty cycle and output polarity. The counter starts decrementing to zero when COUNTERTOP is reached and will invert the OUT[n] when compare value is hit for the second time. This results in a set of pulses that are center-aligned.

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY,
    PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_UpAndDown << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

**Figure 143: PWM up-and-down counter example**

In up-and-down counting modes, the following formula can be used to compute PWM period and step size:

$$T_{\text{PWM(Up And Down)}} = T_{\text{PWM\_CLK}} * 2 * \text{COUNTERTOP}$$

$$\text{Step width/Resolution: } T_{\text{steps}} = T_{\text{PWM\_CLK}} * 2$$

## 47.2 Decoder with EasyDMA

The decoder uses EasyDMA to take PWM parameters stored in Data RAM by ways of EasyDMA and updates the internal compare registers of the wave counter based on the mode of operation.

The mentioned PWM parameters are organized into a sequence containing at least one half word (16 bit). Its most significant bit[15] denotes the polarity of the OUT[n] while bit[14:0] is the 15-bit compare value. See below for further details of these RAM defined registers.

|            |  |  |  |                  |          |             |    |       |    |    |    |    |                                                                |    |    |    |    |    |                                 |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

The DECODER register controls how the RAM content is interpreted and loaded to the internal compare registers. The LOAD field can be used to control if the RAM values are loaded to all compare channels - or alternatively to update a group or all channels with individual values. [Figure 144: Decoder memory access modes](#) on page 499 illustrates how the parameters stored in RAM are organized and routed to the various compare channels in the different modes.

A special mode of operation is available when DECODER.LOAD is set to WaveForm. In this mode, up to three PWM channels can be enabled - OUT[0] to OUT[2]. In RAM, four values are loaded at a time: the first, second and third location are used to load the values, and the fourth RAM location is used to load the COUNTERTOP register. This way one can have up to three PWM channels with a frequency base that changes on a per PWM period basis. This mode of operation is useful for arbitrary wave form generation in applications such as LED lighting.

The register SEQ[n].REFRESH=N (one per sequence n=0 or 1) will instruct a new RAM stored pulse width value on every (N+1)<sup>th</sup> PWM period. Setting the register to zero will result in a new duty cycle update every PWM period as long as the minimum PWM period is observed.

Note that registers SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored when DECODER.MODE=NextStep . The next value is loaded upon receiving every NEXTSTEP task.

Figure 144: Decoder memory access modes

SEQ[n].PTR is the pointer used to fetch COMPARE values from RAM. If the SEQ[n].PTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 23 for more information about the different memory regions.

After the SEQ[n].PTR is set to the desired RAM location, the SEQ[n].CNT register must be set to the number of 16-bit half words in the sequence. It is important to observe that the Grouped and Single modes require one half word per group or one half word per channel respectively, and thus increases RAM size occupation. If PWM generation was not running yet at that point, sending the SEQSTART[n] task will load the first value from RAM, then start the PWM generation. A SEQSTARTED[n] event is generated as soon as the EasyDMA has read the first PWM parameter from RAM and the wave counter has started executing it. When LOOP.CNT=0, sequence n=0 or 1 is played back once. After the last value in the sequence has been loaded and started executing, a SEQEND[n] event is generated. The PWM generation will then continue with the last loaded value. See [Figure 145: Simple sequence example](#) on page 501 for an example of such simple playback.

To completely stop the PWM generation and force the associated pins to a defined state, a STOP task can be fired at any time. A STOPPED event is generated when the PWM generation has stopped at the end of currently running PWM period, and the pins go into their idle state as defined in GPIO->OUT. PWM generation can then only be restarted through a SEQSTART[n] task. SEQSTART[n] will resume PWM generation after having loaded the first value from the RAM buffer defined in the SEQ[n].PTR register.

The table below provides indication of when specific registers get sampled by the hardware. Care should be taken when updating these registers to avoid values to be applied earlier than expected.

**Table 116: When to safely update PWM registers**

| Register        | Taken into account by hardware                                                                                                                                                        | Recommended (safe) update                                                                                                                                                                                                                               |

| LOOP            | Immediately                                                                                                                                                                           | Before starting PWM generation through a SEQSTART[n] task<br><br>After a STOP task has been issued, and the STOPPED event has been received.                                                                                                            |
| PSEL.OUT[n]     | Immediately                                                                                                                                                                           | Before enabling the PWM instance through the ENABLE register                                                                                                                                                                                            |

**Important:** SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored at the end of a complex sequence, indicated by a LOOPSDONE event. The reason for this is that the last value loaded from RAM is maintained until further action from software (restarting a new sequence, or stopping PWM generation).

[Figure 145: Simple sequence example](#) on page 501 depicts the source code used for configuration and timing details in a sequence where only sequence 0 is used and only run once with a new PWM duty cycle for each period.

```
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                          (PWM_PSEL_OUT_CONNECT_Connected <<
                           PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE        = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE          = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER     = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                           PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP    = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP          = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER       = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                          (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR     = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT     = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                           PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

**Figure 145: Simple sequence example**

A more complex example is shown in [Figure 146: Example using two sequences](#) on page 502, where `LOOP.CNT > 0`. In this case, an automated playback takes place, consisting of `SEQ[0]`, delay 1, then again `SEQ[0]`, etc. The user can choose to start a complex playback with `SEQ[0]` or `SEQ[1]` through sending the `SEQSTART[0]` or `SEQSTART[1]` task.

The complex playback always ends with delay 1.

The two sequences 0 and 1 are defined with address of values tables in Data RAM (pointed by `SEQ[n].PTR`) and respective buffer size (`SEQ[n].CNT`). The rate at which a new value is loaded is defined individually for each sequence by `SEQ[n].REFRESH`. The chaining of sequence 1 following sequence 0 is implicit, the `LOOP.CNT` register allows the chaining of sequence 1 to sequence 0 for a determined number of times. In other words, it allows to repeat a complex sequence a number of times in a fully automated way.

In the example below, sequence 0 is defined with `SEQ[0].REFRESH` set to one - that means that a new PWM duty cycle is pushed every second PWM period. This complex sequence is started with the `SEQSTART[0]` task, so `SEQ[0]` is played first. Since `SEQ[0].ENDDELAY=1` there will be one PWM period delay between last period on sequence 0 and the first period on sequence 1. Since `SEQ[1].ENDDELAY=0` there is no delay 1, so `SEQ[0]` would be started immediately after the end of `SEQ[1]`. However, as `LOOP.CNT` is one, the playback stops after having played only once `SEQ[1]`, and both `SEQEND[1]` and `LOOPSDONE` are generated (their order is not guaranteed in this case).

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                          (PWM_PSEL_OUT_CONNECT_Connected <<
                           PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE       = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE         = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER    = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP   = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP         = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER      = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                          (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR   = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT   = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 1;
NRF_PWM0->SEQ[0].ENDDELAY = 1;
NRF_PWM0->SEQ[1].PTR   = ((uint32_t)(seq1_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT   = ((sizeof(seq1_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
  
```

**Figure 146: Example using two sequences**

The decoder can also be configured to asynchronously load a new PWM duty cycle. If the DECODER.MODE register is set to NextStep - then the NEXTSTEP task will cause an update of the internal compare registers on the next PWM period.

The figures below provide an overview of each part of an arbitrary sequence, in various modes (LOOP.CNT=0 and LOOP.CNT>0). In particular are represented:

- Initial and final duty cycle on the PWM output(s)
- Chaining of SEQ[0] and SEQ[1] if LOOP.CNT>0
- Influence of registers on the sequence
- Events fired during a sequence
- DMA activity (loading of next value and applying it to the output(s))

Note that the single-shot example applies also to SEQ[1], only SEQ[0] is represented for simplicity.

Figure 147: Single shot (LOOP.CNT=0)

Figure 148: Complex sequence (LOOP.CNT>0) starting with SEQ[0]

**Figure 149: Complex sequence (LOOP.CNT>0) starting with SEQ[1]**

Note that if a sequence is in use in a simple or complex sequence, it must have a length of  $\text{SEQ}[n].\text{CNT} > 0$ .

## 47.3 Limitations

The previous compare value will be repeated if the PWM period is selected to be shorter than the time it takes for the EasyDMA to fetch from RAM and update the internal compare registers.

This is to ensure a glitch-free operation even if very short PWM periods are chosen.

## 47.4 Pin configuration

The  $\text{OUT}[n]$  ( $n=0..3$ ) signals associated to each channel of the PWM module are mapped to physical pins according to the configuration specified in the respective  $\text{PSEL.OUT}[n]$  registers. If a  $\text{PSEL.OUT}[n].\text{CONNECT}$  is set to Disconnected, the associated PWM module signal will not be connected to any physical pins.

The  $\text{PSEL.OUT}[n]$  registers and their configurations are only used as long as the PWM module is enabled and PWM generation is active (wave counter started), and retained only as long as the device is in System ON mode, see [POWER](#) chapter for more information about power modes.

To ensure correct behaviour in the PWM module, the pins used by the PWM module must be configured in the GPIO peripheral as described in [Table 117: Recommended GPIO configuration before starting PWM generation](#) on page 505 before enabling the PWM module. The pins' idle state is defined by the OUT registers in the GPIO module. This is to ensure that the pins used by the PWM module are driven correctly, if PWM generation is stopped through a STOP task, the PWM module itself is temporarily disabled, or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected IOs as long as the PWM module is supposed to be connected to an external PWM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behaviour.

**Table 117: Recommended GPIO configuration before starting PWM generation**

| PWM signal | PWM pin                                 | Direction | Output value | Comment                         |
|------------|-----------------------------------------|-----------|--------------|---------------------------------|
| OUT[n]     | As specified in PSEL.OUT[n]<br>(n=0..3) | Output    | 0            | Idle state defined in GPIO->OUT |

## 47.5 Registers

**Table 118: Instances**

| Base address | Peripheral | Instance | Description                   | Configuration |
|--------------|------------|----------|-------------------------------|---------------|
| 0x4001C000   | PWM        | PWM0     | Pulse Width Modulation Unit 0 |               |
| 0x40021000   | PWM        | PWM1     | Pulse Width Modulation Unit 1 |               |
| 0x40022000   | PWM        | PWM2     | Pulse Width Modulation Unit 2 |               |

**Table 119: Register Overview**

| Register             | Offset | Description                                                                                                                                                                                                      |
|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_STOP           | 0x004  | Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback                                                                                                         |
| TASKS_SEQSTART[0]    | 0x008  | Loads the first PWM value on all enabled channels from sequence 0, and starts playing that sequence at the rate defined in SEQ[0]REFRESH and/or DECODER.MODE. Causes PWM generation to start it was not running. |
| TASKS_SEQSTART[1]    | 0x00C  | Loads the first PWM value on all enabled channels from sequence 1, and starts playing that sequence at the rate defined in SEQ[1]REFRESH and/or DECODER.MODE. Causes PWM generation to start it was not running. |
| TASKS_NEXTSTEP       | 0x010  | Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start it was not running.                                                          |
| EVENTS_STOPPED       | 0x104  | Response to STOP task, emitted when PWM pulses are no longer generated                                                                                                                                           |
| EVENTS_SEQSTARTED[0] | 0x108  | First PWM period started on sequence 0                                                                                                                                                                           |
| EVENTS_SEQSTARTED[1] | 0x10C  | First PWM period started on sequence 1                                                                                                                                                                           |
| EVENTS_SEQEND[0]     | 0x110  | Emitted at end of every sequence 0, when last value from RAM has been applied to wave counter                                                                                                                    |
| EVENTS_SEQEND[1]     | 0x114  | Emitted at end of every sequence 1, when last value from RAM has been applied to wave counter                                                                                                                    |
| EVENTS_PWMPERIODEN   | 0x118  | Emitted at the end of each PWM period                                                                                                                                                                            |
| EVENTS_LOOPSDONE     | 0x11C  | Concatenated sequences have been played the amount of times defined in LOOP.CNT                                                                                                                                  |

## 47.6 Electrical specification

### 47.6.1 PWM Electrical Specification

| Symbol                         | Description                                                                 | Min. | Typ. | Max. | Units         |
|--------------------------------|-----------------------------------------------------------------------------|------|------|------|---------------|
| $I_{\text{PWM},16\text{MHz}}$  | PWM run current, Prescaler set to DIV_1 (16 MHz), excluding DMA and GPIO    |      | 200  |      | $\mu\text{A}$ |
| $I_{\text{PWM},8\text{MHz}}$   | PWM run current, Prescaler set to DIV_2 (8 MHz), excluding DMA and GPIO     |      | 150  |      | $\mu\text{A}$ |
| $I_{\text{PWM},125\text{kHz}}$ | PWM run current, Prescaler set to DIV_128 (125 kHz), excluding DMA and GPIO |      | 150  |      | $\mu\text{A}$ |

## 48 SPI — Serial peripheral interface master

The SPI master provides a simple CPU interface which includes a TXD register for sending data and an RXD register for receiving data. This section is added for legacy support for now.

**Figure 150: SPI master**

RXD-1 and TXD+1 illustrate the double buffered version of RXD and TXD respectively.

### 48.1 Functional description

The TXD and RXD registers are double-buffered to enable some degree of uninterrupted data flow in and out of the SPI master.

The SPI master does not implement support for chip select directly. Therefore, the CPU must use available GPIOs to select the correct slave and control this independently of the SPI master. The SPI master supports SPI modes 0 through 3.

**Table 120: SPI modes**

| Mode                  | Clock polarity<br>CPOL | Clock phase<br>CPHA |
|-----------------------|------------------------|---------------------|
| SPI_MODE 0 (Leading)  | 0 (Active High)        | 0 (Active High)     |
| SPI_MODE 0 (Leading)  | 1 (Active Low)         | 1 (Active Low)      |
| SPI_MODE 1 (Trailing) | 0 (Active High)        | 0 (Active High)     |
| SPI_MODE 1 (Trailing) | 1 (Active Low)         | 1 (Active Low)      |

#### 48.1.1 SPI master mode pin configuration

The different signals SCK, MOSI, and MISO associated with the SPI master are mapped to physical pins.

This mapping is according to the configuration specified in the PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers respectively. If a value of 0xFFFFFFFF is specified in any of these registers, the associated SPI master signal is not connected to any physical pin. The PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers and their configurations are only used as long as the SPI master is enabled, and retained only as long as the device is in ON mode. PSEL.SCK, PSEL.MOSI, and PSEL.MISO must only be configured when the SPI master is disabled.

To secure correct behavior in the SPI, the pins used by the SPI must be configured in the GPIO peripheral as described in [Table 121: GPIO configuration](#) on page 515 prior to enabling the SPI. The SCK must

always be connected to a pin, and that pin's input buffer must always be connected for the SPI to work. This configuration must be retained in the GPIO for the selected IOs as long as the SPI is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time, failing to do so may result in unpredictable behavior.

**Table 121: GPIO configuration**

| SPI master signal | SPI master pin           | Direction | Output value        |
|-------------------|--------------------------|-----------|---------------------|
| SCK               | As specified in PSELCK   | Output    | Same as CONFIG.CPOL |
| MOSI              | As specified in PSELMOSI | Output    | 0                   |
| MISO              | As specified in PSELMISO | Input     | Not applicable      |

### 48.1.2 Shared resources

The SPI shares registers and other resources with other peripherals that have the same ID as the SPI. Therefore, the user must disable all peripherals that have the same ID as the SPI before the SPI can be configured and used.

Disabling a peripheral that has the same ID as the SPI will not reset any of the registers that are shared with the SPI. It is therefore important to configure all relevant SPI registers explicitly to secure that it operates correctly.

See the Instantiation table in [Instantiation](#) on page 24 for details on peripherals and their IDs.

### 48.1.3 SPI master transaction sequence

An SPI master transaction is started by writing the first byte, which is to be transmitted by the SPI master, to the TXD register.

Since the transmitter is double buffered, the second byte can be written to the TXD register immediately after the first one. The SPI master will then send these bytes in the order they are written to the TXD register.

The SPI master is a synchronous interface, and for every byte that is sent, a different byte will be received at the same time; this is illustrated in [Figure 151: SPI master transaction](#) on page 516. Bytes that are received will be moved to the RXD register where the CPU can extract them by reading the register. The RXD register is double buffered in the same way as the TXD register, and a second byte can therefore be received at the same time as the first byte is being extracted from RXD by the CPU. The SPI master will generate a READY event every time a new byte is moved to the RXD register. The double buffered byte will be moved from RXD-1 to RXD as soon as the first byte is extracted from RXD. The SPI master will stop when there are no more bytes to send in TXD and TXD+1.

**Figure 151: SPI master transaction**

The READY event of the third byte transaction is delayed until B is extracted from RXD in occurrence number 3 on the horizontal lifeline. The reason for this is that the third event is generated first when C is moved from RXD-1 to RXD after B is read.

The SPI master will move the incoming byte to the RXD register after a short delay following the SCK clock period of the last bit in the byte. This also means that the READY event will be delayed accordingly, see [Figure 152: SPI master transaction](#) on page 516. Therefore, it is important that you always clear the READY event, even if the RXD register and the data that is being received is not used.

**Figure 152: SPI master transaction**

## 48.2 Registers

**Table 122: Instances**

| Base address | Peripheral | Instance | Description  | Configuration |
|--------------|------------|----------|--------------|---------------|
| 0x40003000   | SPI        | SPI0     | SPI master 0 | Deprecated    |
| 0x40004000   | SPI        | SPI1     | SPI master 1 | Deprecated    |
| 0x40023000   | SPI        | SPI2     | SPI master 2 | Deprecated    |

**Table 123: Register Overview**

| Register                  | Offset | Description                         |

## 48.3 Electrical specification

### 48.3.1 SPI master interface

| Symbol             | Description                                                                   | Min. | Typ.                    | Max.            | Units   |
|--------------------|-------------------------------------------------------------------------------|------|-------------------------|-----------------|---------|
| $f_{SPI}$          | Bit rates for SPI <sup>39</sup>                                               |      |                         | 8 <sup>40</sup> | Mbps    |
| $I_{SPI,2Mbps}$    | Run current for SPI, 2 Mbps                                                   |      |                         | 50              | $\mu A$ |
| $I_{SPI,8Mbps}$    | Run current for SPI, 8 Mbps                                                   |      |                         | 50              | $\mu A$ |
| $I_{SPI,IDLE}$     | Idle current for SPI (STARTed, no CSN activity)                               |      | <1                      |                 | $\mu A$ |
| $t_{SPI,START,LP}$ | Time from writing TXD register to transmission started, low power mode        |      | $t_{SPI,START,CI}$<br>+ |                 | $\mu s$ |
| $t_{SPI,START,CL}$ | Time from writing TXD register to transmission started, constant latency mode |      | 1                       |                 | $\mu s$ |

### 48.3.2 Serial Peripheral Interface (SPI) Master timing specifications

| Symbol               | Description                            | Min. | Typ. | Max.           | Units |
|----------------------|----------------------------------------|------|------|----------------|-------|
| $t_{SPI,CSCK,8Mbps}$ | SCK period at 8Mbps                    |      | 125  |                | ns    |
| $t_{SPI,CSCK,4Mbps}$ | SCK period at 4Mbps                    |      | 250  |                | ns    |
| $t_{SPI,CSCK,2Mbps}$ | SCK period at 2Mbps                    |      | 500  |                | ns    |
| $t_{SPI,RSCK,LD}$    | SCK rise time, low drive <sup>a</sup>  |      |      | $t_{RF,25pF}$  |       |
| $t_{SPI,RSCK,HD}$    | SCK rise time, high drive <sup>a</sup> |      |      | $t_{HRF,25pF}$ |       |
| $t_{SPI,FSCK,LD}$    | SCK fall time, low drive <sup>a</sup>  |      |      | $t_{RF,25pF}$  |       |
| $t_{SPI,FSCK,HD}$    | SCK fall time, high drive <sup>a</sup> |      |      | $t_{HRF,25pF}$ |       |

<sup>39</sup> Higher bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

<sup>40</sup> The actual maximum data rate depends on the slave's CLK to MISO and MOSI setup and hold timings.

<sup>a</sup> At 25pF load, including GPIO capacitance, see GPIO spec.

| Symbol                 | Description                   | Min.                          | Typ. | Max. | Units |
|------------------------|-------------------------------|-------------------------------|------|------|-------|
| $t_{\text{SPI,WHSCK}}$ | SCK high time <sup>a</sup>    | $(0.5 \cdot t_{\text{CSCK}})$ |      |      |       |
| $t_{\text{SPI,WLSCK}}$ | SCK low time <sup>a</sup>     | $(0.5 \cdot t_{\text{CSCK}})$ |      |      |       |
| $t_{\text{SPI,SUMI}}$  | MISO to CLK edge setup time   | 19                            |      |      | ns    |
| $t_{\text{SPI,HMI}}$   | CLK edge to MISO hold time    | 18                            |      |      | ns    |
| $t_{\text{SPI,VMO}}$   | CLK edge to MOSI valid        |                               |      | 59   | ns    |
| $t_{\text{SPI,HMO}}$   | MOSI hold time after CLK edge | 20                            |      |      | ns    |

Figure 153: SPI master timing diagram

## 49 TWI — I<sup>2</sup>C compatible two-wire interface

The TWI master is compatible with I<sup>2</sup>C operating at 100 kHz and 400 kHz.

**Figure 154: TWI master's main features**

### 49.1 Functional description

This TWI master is not compatible with CBUS. The TWI transmitter and receiver are single buffered.

See, [Figure 154: TWI master's main features](#) on page 522.

A TWI setup comprising one master and three slaves is illustrated in [Figure 155: A typical TWI setup comprising one master and three slaves](#) on page 522. This TWI master is only able to operate as the only master on the TWI bus.

**Figure 155: A typical TWI setup comprising one master and three slaves**

This TWI master supports clock stretching performed by the slaves. The TWI master is started by triggering the STARTTX or STARTRX tasks, and stopped by triggering the STOP task.

If a NACK is clocked in from the slave, the TWI master will generate an ERROR event.

### 49.2 Master mode pin configuration

The different signals SCL and SDA associated with the TWI master are mapped to physical pins according to the configuration specified in the PSELSCL and PSELSDA registers respectively.

If a value of 0xFFFFFFFF is specified in any of these registers, the associated TWI master signal is not connected to any physical pin. The PSELSCL and PSELSDA registers and their configurations are only used

as long as the TWI master is enabled, and retained only as long as the device is in ON mode. PSEL\_SCL and PSEL\_SDA must only be configured when the TWI is disabled.

To secure correct signal levels on the pins used by the TWI master when the system is in OFF mode, and when the TWI master is disabled, these pins must be configured in the GPIO peripheral as described in [Table 124: GPIO configuration](#) on page 523.

Only one peripheral can be assigned to drive a particular GPIO pin at a time, failing to do so may result in unpredictable behavior.

**Table 124: GPIO configuration**

| TWI master signal | TWI master pin           | Direction | Drive strength | Output value   |
|-------------------|--------------------------|-----------|----------------|----------------|
| SCL               | As specified in PSEL_SCL | Input     | S0D1           | Not applicable |
| SDA               | As specified in PSEL_SDA | Input     | S0D1           | Not applicable |

## 49.3 Shared resources

The TWI shares registers and other resources with other peripherals that have the same ID as the TWI.

Therefore, you must disable all peripherals that have the same ID as the TWI before the TWI can be configured and used. Disabling a peripheral that has the same ID as the TWI will not reset any of the registers that are shared with the TWI. It is therefore important to configure all relevant TWI registers explicitly to secure that it operates correctly.

The Instantiation table in [Instantiation](#) on page 24 shows which peripherals have the same ID as the TWI.

## 49.4 Master write sequence

A TWI master write sequence is started by triggering the STARTTX task. After the STARTTX task has been triggered, the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE=0, READ=1).

The address must match the address of the slave device that the master wants to write to. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) generated by the slave.

After receiving the ACK bit, the TWI master will clock out the data bytes that are written to the TXD register. Each byte clocked out from the master will be followed by an ACK/NACK bit clocked in from the slave. A TXDSENT event will be generated each time the TWI master has clocked out a TXD byte, and the associated ACK/NACK bit has been clocked in from the slave.

The TWI master transmitter is single buffered, and a second byte can only be written to the TXD register after the previous byte has been clocked out and the ACK/NACK bit clocked in, that is, after the TXDSENT event has been generated.

If the CPU is prevented from writing to TXD when the TWI master is ready to clock out a byte, the TWI master will stretch the clock until the CPU has written a byte to the TXD register.

A typical TWI master write sequence is illustrated in [Figure 156: The TWI master writing data to a slave](#) on page 524. Occurrence 3 in the figure illustrates delayed processing of the TXDSENT event associated with TXD byte 1. In this scenario the TWI master will stretch the clock to prevent writing erroneous data to the slave.

**Figure 156: The TWI master writing data to a slave**

The TWI master write sequence is stopped when the STOP task is triggered whereupon the TWI master will generate a stop condition on the TWI bus.

## 49.5 Master read sequence

A TWI master read sequence is started by triggering the STARTRX task. After the STARTRX task has been triggered the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE = 0, READ = 1).

The address must match the address of the slave device that the master wants to read from. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK = 1) generated by the slave.

After having sent the ACK bit the TWI slave will send data to the master using the clock generated by the master.

The TWI master will generate a RXDRDY event every time a new byte is received in the RXD register.

After receiving a byte, the TWI master will delay sending the ACK/NACK bit by stretching the clock until the CPU has extracted the received byte, that is, by reading the RXD register.

The TWI master read sequence is stopped by triggering the STOP task. This task must be triggered before the last byte is extracted from RXD to ensure that the TWI master sends a NACK back to the slave before generating the stop condition.

A typical TWI master read sequence is illustrated in [Figure 157: The TWI master reading data from a slave](#) on page 525. Occurrence 3 in this figure illustrates delayed processing of the RXDRDY event associated with RXD byte B. In this scenario the TWI master will stretch the clock to prevent the slave from overwriting the contents of the RXD register.

Figure 157: The TWI master reading data from a slave

## 49.6 Master repeated start sequence

A typical repeated start sequence is one in which the TWI master writes one byte to the slave followed by reading M bytes from the slave. Any combination and number of transmit and receive sequences can be combined in this fashion. Only one shortcut to STOP can be enabled at any given time.

The figure below illustrates a repeated start sequence where the TWI master writes one byte, followed by reading M bytes from the slave without performing a stop in-between.

Figure 158: A repeated start sequence, where the TWI master writes one byte, followed by reading M bytes from the slave without performing a stop in-between

To generate a repeated start after a read sequence, a second start task must be triggered instead of the STOP task, that is, STARTRX or STARTTX. This start task must be triggered before the last byte is extracted from RXD to ensure that the TWI master sends a NACK back to the slave before generating the repeated start condition.

## 49.7 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

## 49.8 Registers

**Table 125: Instances**

| Base address | Peripheral | Instance | Description                 | Configuration |
|--------------|------------|----------|-----------------------------|---------------|
| 0x40003000   | TWI        | TWI0     | Two-wire interface master 0 | Deprecated    |
| 0x40004000   | TWI        | TWI1     | Two-wire interface master 1 | Deprecated    |

**Table 126: Register Overview**

| Register         | Offset | Description                                                            |
|------------------|--------|------------------------------------------------------------------------|
| TASKS_STARTRX    | 0x000  | Start TWI receive sequence                                             |
| TASKS_STARTTX    | 0x008  | Start TWI transmit sequence                                            |

  ## 50 UART — Universal asynchronous receiver/ transmitter

**Figure 160: UART configuration**

### 50.1 Functional description

Listed here are the main features of UART.

The UART implements support for the following features:

- Full-duplex operation
- Automatic flow control
- Parity checking and generation for the 9<sup>th</sup> data bit

As illustrated in [Figure 160: UART configuration](#) on page 532, the UART uses the TXD and RXD registers directly to transmit and receive data. The UART uses one stop bit.

### 50.2 Pin configuration

The different signals RXD, CTS (Clear To Send, active low), RTS (Request To Send, active low), and TXD associated with the UART are mapped to physical pins according to the configuration specified in the PSELRXD, PSELCTS, PSELRTS, and PSELTxD registers respectively.

If a value of 0xFFFFFFFF is specified in any of these registers, the associated UART signal will not be connected to any physical pin. The PSELRXD, PSELCTS, PSELRTS, and PSELTxD registers and their configurations are only used as long as the UART is enabled, and retained only for the duration the device is in ON mode. PSELRXD, PSELCTS, PSELRTS and PSELTxD must only be configured when the UART is disabled.

To secure correct signal levels on the pins by the UART when the system is in OFF mode, the pins must be configured in the GPIO peripheral as described in [Pin configuration](#) on page 532.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

**Table 127: GPIO configuration**

| UART pin | Direction | Output value   |
|----------|-----------|----------------|
| RXD      | Input     | Not applicable |
| CTS      | Input     | Not applicable |
| RTS      | Output    | 1              |
| TXD      | Output    | 1              |

## 50.3 Shared resources

The UART shares registers and other resources with other peripherals that have the same ID as the UART.

Therefore, you must disable all peripherals that have the same ID as the UART before the UART can be configured and used. Disabling a peripheral that has the same ID as the UART will not reset any of the registers that are shared with the UART. It is therefore important to configure all relevant UART registers explicitly to ensure that it operates correctly.

See the Instantiation table in [Instantiation](#) on page 24 for details on peripherals and their IDs.

## 50.4 Transmission

A UART transmission sequence is started by triggering the STARTTX task.

Bytes are transmitted by writing to the TXD register. When a byte has been successfully transmitted the UART will generate a TXDRDY event after which a new byte can be written to the TXD register. A UART transmission sequence is stopped immediately by triggering the STOPTX task.

If flow control is enabled a transmission will be automatically suspended when CTS is deactivated and resumed when CTS is activated again, as illustrated in [Figure 161: UART transmission](#) on page 533. A byte that is in transmission when CTS is deactivated will be fully transmitted before the transmission is suspended. For more information, see [Suspending the UART](#) on page 534.

**Figure 161: UART transmission**

## 50.5 Reception

A UART reception sequence is started by triggering the STARTRX task.

The UART receiver chain implements a FIFO capable of storing six incoming RXD bytes before data is overwritten. Bytes are extracted from this FIFO by reading the RXD register. When a byte is extracted from the FIFO a new byte pending in the FIFO will be moved to the RXD register. The UART will generate an RXDRDY event every time a new byte is moved to the RXD register.

When flow control is enabled, the UART will deactivate the RTS signal when there is only space for four more bytes in the receiver FIFO. The counterpart transmitter is therefore able to send up to four bytes after the RTS signal is deactivated before data is being overwritten. To prevent overwriting data in the FIFO, the counterpart UART transmitter must therefore make sure to stop transmitting data within four bytes after the RTS line is deactivated.

The RTS signal will first be activated again when the FIFO has been emptied, that is, when all bytes in the FIFO have been read by the CPU, see [Figure 162: UART reception](#) on page 534.

The RTS signal will also be deactivated when the receiver is stopped through the STOPRX task as illustrated in [Figure 162: UART reception](#) on page 534. The UART is able to receive four to five additional bytes if they are sent in succession immediately after the RTS signal has been deactivated. This is possible because the UART is, even after the STOPRX task is triggered, able to receive bytes for an extended period of time dependent on the configured baud rate. The UART will generate a receiver timeout event (RXTO) when this period has elapsed.

To prevent loss of incoming data the RXD register must only be read one time following every RXDRDY event.

To secure that the CPU can detect all incoming RXDRDY events through the RXDRDY event register, the RXDRDY event register must be cleared before the RXD register is read. The reason for this is that the UART is allowed to write a new byte to the RXD register, and therefore can also generate a new event, immediately after the RXD register is read (emptied) by the CPU.

**Figure 162: UART reception**

As indicated in occurrence 2 in the figure, the RXDRDY event associated with byte B is generated first after byte A has been extracted from RXD.

## 50.6 Suspending the UART

The UART can be suspended by triggering the SUSPEND task.

SUSPEND will affect both the UART receiver and the UART transmitter, i.e. the transmitter will stop transmitting and the receiver will stop receiving. UART transmission and reception can be resumed, after being suspended, by triggering STARTTX and STARTRX respectively.

Following a SUSPEND task, an ongoing TXD byte transmission will be completed before the UART is suspended.

When the SUSPEND task is triggered, the UART receiver will behave in the same way as it does when the STOPRX task is triggered.

## 50.7 Error conditions

An ERROR event, in the form of a framing error, will be generated if a valid stop bit is not detected in a frame. Another ERROR event, in the form of a break condition, will be generated if the RXD line is held active low for longer than the length of a data frame. Effectively, a framing error is always generated before a break condition occurs.

## 50.8 Using the UART without flow control

If flow control is not enabled, the interface will behave as if the CTS and RTS lines are kept active all the time.

## 50.9 Parity configuration

When parity is enabled, the parity will be generated automatically from the even parity of TXD and RXD for transmission and reception respectively.

## 50.10 Registers

**Table 128: Instances**

| Base address | Peripheral | Instance | Description                                     | Configuration |
|--------------|------------|----------|-------------------------------------------------|---------------|
| 0x40002000   | UART       | UART0    | Universal Asynchronous Receiver/<br>Transmitter | Deprecated    |

**Table 129: Register Overview**

| Register      | Offset | Description                                       |
|---------------|--------|---------------------------------------------------|
| TASKS_STARTRX | 0x000  | Start UART receiver                               |
| TASKS_STOPRX  | 0x004  | Stop UART receiver                                |
| TASKS_STARTTX | 0x008  | Start UART transmitter                            |
| TASKS_STOPTX  | 0x00C  | Stop UART transmitter                             |
| TASKS_SUSPEND | 0x01C  | Suspend UART                                      |
| EVENTS_CTS    | 0x100  | CTS is activated (set low). Clear To Send.        |
| EVENTS_NCTS   | 0x104  | CTS is deactivated (set high). Not Clear To Send. |
| EVENTS_RXDRDY | 0x108  | Data received in RXD                              |
| EVENTS_TXDRDY | 0x11C  | Data sent from TXD                                |
| EVENTS_ERROR  | 0x124  | Error detected                                    |
| EVENTS_RXT0   | 0x144  | Receiver timeout                                  |

 ## 50.11 Electrical specification

### 50.11.1 UART electrical specification

| Symbol                     | Description                                                                   | Min. | Typ.                         | Max.                    | Units         |
|----------------------------|-------------------------------------------------------------------------------|------|------------------------------|-------------------------|---------------|
| $f_{\text{UART}}$          | Baud rate for UART <sup>42</sup> .                                            |      |                              | 1000                    | kbps          |
| $I_{\text{UART1M}}$        | Run current at max baud rate.                                                 |      | 55                           |                         | $\mu\text{A}$ |
| $I_{\text{UART115k}}$      | Run current at 115200 bps.                                                    |      | 55                           |                         | $\mu\text{A}$ |
| $I_{\text{UART1k2}}$       | Run current at 1200 bps.                                                      |      | 55                           |                         | $\mu\text{A}$ |
| $I_{\text{UART,IDLE}}$     | Idle current for UART                                                         |      | 1                            |                         | $\mu\text{A}$ |
| $t_{\text{UART,CTSH}}$     | CTS high time                                                                 | 1    |                              |                         | $\mu\text{s}$ |
| $t_{\text{UART,START,LP}}$ | Time from STARTRX/STARTTX task to transmission started, low power mode        |      | $t_{\text{UART,START}}$<br>+ | $t_{\text{START,HFIN}}$ | $\mu\text{s}$ |
| $t_{\text{UART,START,CL}}$ | Time from STARTRX/STARTTX task to transmission started, constant latency mode |      | 1                            |                         | $\mu\text{s}$ |

<sup>42</sup> Higher baud rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

## 51 Mechanical specifications

The mechanical specifications for the packages show the dimensions in millimeters.

### 51.1 QFN48 6 x 6 mm package

Figure 163: QFN48 6 x 6 mm package

Table 130: QFN48 dimensions in millimeters

| Package     | A    | A1   | A3  | b    | D, E | D2, E2 | e   | K    | L    |      |
|-------------|------|------|-----|------|------|--------|-----|------|------|------|
| QFN48 (6x6) | 0.80 | 0.00 |     | 0.15 |      | 4.50   |     | 0.20 | 0.35 | Min. |
|             | 0.85 | 0.02 | 0.2 | 0.20 | 6.0  | 4.60   | 0.4 |      | 0.40 | Nom. |
|             | 0.90 | 0.05 |     | 0.25 |      | 4.70   |     |      | 0.45 | Max. |

| WLCSP (3.0 × 3.2) | 0.351 | 0.13 |       | 0.19 |       |       |     |     |     |     |     | Min. |
|                   | 0.375 | 0.15 | 0.225 | 0.20 | 2.956 | 3.226 | 2.4 | 2.8 | 0.4 | 1.4 | 1.2 | Nom. |
|                   | 0.399 | 0.17 |       | 0.25 |       |       |     |     |     |     |     | Max. |

## 52 Ordering information

This chapter contains information on IC marking, ordering codes, and container sizes.

### 52.1 IC marking

The nRF52832 IC package is marked like described below.

|    |    |    |    |     |     |
|----|----|----|----|-----|-----|
| N  | 5  | 2  | 8  | 3   | 2   |
| <P | P> | <V | V> | <H> | <P> |
| <Y | Y> | <W | W> | <L  | L>  |

Figure 165: Package marking

### 52.2 Box labels

Here are the box labels used for the nRF52832.

Figure 166: Inner box label

|                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                   |

Table 132: Abbreviations

| Abbreviation | Definition and implemented codes                                     |
|--------------|----------------------------------------------------------------------|
| N52/nRF52    | nRF52 Series product                                                 |
| 832          | Part code                                                            |
| <PP>         | Package variant code                                                 |
| <VV>         | Function variant code                                                |
| <H><P><F>    | Build code                                                           |
|              | H - Hardware version code                                            |
|              | P - Production configuration code (production site, etc.)            |
|              | F - Firmware version code (only visible on shipping container label) |
| <YY><WW><LL> | Tracking code                                                        |
|              | YY - Year code                                                       |
|              | WW - Assembly week number                                            |
|              | LL - Wafer lot code                                                  |
| <CC>         | Container code                                                       |

## 52.4 Code ranges and values

Defined here are the nRF52832 code ranges and values.

**Table 133: Package variant codes**

| <PP> | Package | Size (mm) | Pin/Ball count | Pitch (mm) |
|------|---------|-----------|----------------|------------|
| QF   | QFN     | 6 x 6     | 48             | 0.4        |
| CI   | WLCSP   | 3.0 x 3.2 | 50             | 0.4        |

**Table 134: Function variant codes**

| <VV> | Flash (kB) | RAM (kB) |
|------|------------|----------|
| AA   | 512        | 64       |
| AB   | 256        | 32       |

**Table 135: Hardware version codes**

| <H>       | Description                                        |
|-----------|----------------------------------------------------|
| [A . . Z] | Hardware version/revision identifier (incremental) |

**Table 136: Production configuration codes**

| <P>       | Description                                 |
|-----------|---------------------------------------------|
| [0 . . 9] | Production device identifier (incremental)  |
| [A . . Z] | Engineering device identifier (incremental) |

**Table 137: Production version codes**

| <F>                | Description                              |
|--------------------|------------------------------------------|
| [A . . N, P . . Z] | Version of preprogrammed firmware        |
| [0]                | Delivered without preprogrammed firmware |

**Table 138: Year codes**

| <YY>        | Description                   |
|-------------|-------------------------------|
| [15 . . 99] | Production year: 2015 to 2099 |

**Table 139: Week codes**

| <WW>       | Description        |
|------------|--------------------|
| [1 . . 52] | Week of production |

**Table 140: Lot codes**

| <LL>        | Description                     |
|-------------|---------------------------------|
| [AA . . ZZ] | Wafer production lot identifier |

**Table 141: Container codes**

| <CC> | Description |
|------|-------------|
| R7   | 7" Reel     |
| R    | 13" Reel    |
| T    | Tray        |

## 52.5 Product options

Defined here are the nRF52832 product options.

**Table 142: nRF52832 order codes**

| Order code       | Minimum ordering quantity (MOQ) | Comment                       |
|------------------|---------------------------------|-------------------------------|
| nRF52832-QFAA-R7 | 1000                            | Availability to be announced. |
| nRF52832-QFAA-R  | 3000                            |                               |
| nRF52832-QFAA-T  | 490                             |                               |
| nRF52832-CIAA-R7 | 1500                            |                               |
| nRF52832-CIAA-R  | 7000                            |                               |
| nRF52832-QFAB-R  | 3000                            |                               |
| nRF52832-QFAB-R7 | 1000                            |                               |
| nRF52832-QFAB-T  | 490                             |                               |

**Table 143: Development tools order code**

| Order code | Description           |
|------------|-----------------------|
| nRF52-DK   | nRF52 Development Kit |

## 53 Reference circuitry

To ensure good RF performance when designing PCBs, it is highly recommended to use the PCB layouts and component values provided by Nordic Semiconductor.

Documentation for the different package reference circuits, including Altium Designer files, PCB layout files, and PCB production files can be downloaded from [Reference layout nRF52 Series](#).

### 53.1 Schematic QFAA and QFAB QFN48 with internal LDO setup

**Figure 169: QFAA and QFAB QFN48 with internal LDO setup**

For PCB reference layouts, see [Reference layout nRF52 Series](#).

**Table 144: Bill of material for OFAA and OFAB OFN48 with internal LDO setup**

| Designator       | Value                              | Description                                                                             | Footprint |
|------------------|------------------------------------|-----------------------------------------------------------------------------------------|-----------|
| C1, C2, C11, C12 | 12 pF                              | Capacitor, NP0, ±2%                                                                     | 0402      |
| C3               | 0.8 pF                             | Capacitor, NP0, ±5%                                                                     | 0402      |
| C4, C5, C8       | 100 nF                             | Capacitor, X7R, ±10%                                                                    | 0402      |

## 53.7 PCB guidelines

A well-designed PCB is necessary to achieve good RF performance. A poor layout can lead to loss in performance or functionality.

A qualified RF layout for the IC and its surrounding components, including matching networks, can be downloaded from [Reference layout nRF52 Series](#).

To ensure optimal performance, it is essential that you follow the schematics and layout references closely. Especially in the case of the antenna matching circuitry (components between device pin ANT and the antenna), any changes to the layout can change the behavior, resulting in degradation of RF performance or a need to change component values. All the reference circuits are designed for use with a 50 ohm single end antenna.

A PCB with a minimum of two layers, including a ground plane, is recommended for optimal performance. On PCBs with more than two layers, put a keep-out area on the inner layers directly below the antenna

matching circuitry (components between device pin ANT and the antenna) to reduce the stray capacitances that influence RF performance.

A matching network is needed between the RF pin ANT and the antenna, to match the antenna impedance (normally 50 ohm) to the optimum RF load impedance for the chip. For optimum performance, the impedance for the matching network should be set as described in the recommended package reference circuitry in [Reference circuitry](#) on page 546 above.

The DC supply voltage should be decoupled as close as possible to the VDD pins with high performance RF capacitors. See the schematics for recommended decoupling capacitor values. The supply voltage for the chip should be filtered and routed separately from the supply voltages of any digital circuitry.

Long power supply lines on the PCB should be avoided. All device grounds, VDD connections, and VDD bypass capacitors must be connected as close as possible to the IC. For a PCB with a topside RF ground plane, the VSS pins should be connected directly to the ground plane. For a PCB with a bottom ground plane, the best technique is to have via holes as close as possible to the VSS pads. A minimum of one via hole should be used for each VSS pin.

Fast switching digital signals should not be routed close to the crystal or the power supply lines. Capacitive loading of fast switching digital output lines should be minimized in order to avoid radio interference.

## 53.8 PCB layout example

The PCB layout shown below is a reference layout for the QFN package with internal LDO setup.

**Important:** Pay attention to how the capacitor C3 is grounded. It is not directly connected to the ground plane, but grounded via VSS pin 31. This is done to create additional filtering of harmonic components.

For all available reference layouts, see [Reference layout nRF52 Series](#).

Figure 175: Top silk layer

Figure 176: Top layer

Figure 177: Bottom layer

**Important:** No components in bottom layer.

## 54 Liability disclaimer

Nordic Semiconductor ASA reserves the right to make changes without further notice to the product to improve reliability, function or design. Nordic Semiconductor ASA does not assume any liability arising out of the application or use of any product or circuits described herein.

### 54.1 RoHS and REACH statement

Nordic Semiconductor products meet the requirements of Directive 2002/95/EC of the European Parliament and of the Council on the Restriction of Hazardous Substances (RoHS) and the requirements of the REACH regulation (EC 1907/2006) on Registration, Evaluation, Authorization and Restriction of Chemicals.

The SVHC (Substances of Very High Concern) candidate list is continually being updated. Complete hazardous substance reports, material composition reports and latest version of Nordic's REACH statement can be found on our website .

### 54.2 Life support applications

Nordic Semiconductor products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury.

Nordic Semiconductor ASA customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nordic Semiconductor ASA for any damages resulting from such improper use or sale.
