|----------------------------------------------------------------------|-----------|
| <b>1 Revision history.....</b>                                       | <b>9</b>  |
| <b>2 About this document.....</b>                                    | <b>10</b> |
| 2.1 Peripheral naming and abbreviations.....                         | 10        |
| 2.2 Register tables.....                                             | 10        |
| 2.3 Registers.....                                                   | 11        |
| <b>3 Block diagram.....</b>                                          | <b>12</b> |
| <b>4 Pin assignments.....</b>                                        | <b>13</b> |
| 4.1 QFN48 pin assignments.....                                       | 13        |
| 4.2 WLCSP ball assignments.....                                      | 15        |
| 4.3 GPIO usage restrictions.....                                     | 17        |
| <b>5 Absolute maximum ratings.....</b>                               | <b>19</b> |
| <b>6 Recommended operating conditions.....</b>                       | <b>20</b> |
| <b>7 CPU.....</b>                                                    | <b>21</b> |
| 7.1 Floating point interrupt.....                                    | 21        |
| 7.2 Electrical specification.....                                    | 21        |
| 7.3 CPU and support module configuration.....                        | 22        |
| <b>8 Memory.....</b>                                                 | <b>23</b> |
| 8.1 RAM - Random access memory.....                                  | 23        |
| 8.2 Flash - Non-volatile memory.....                                 | 24        |
| 8.3 Memory map.....                                                  | 24        |
| 8.4 Instantiation.....                                               | 24        |
| <b>9 AHB multilayer.....</b>                                         | <b>26</b> |
| 9.1 AHB multilayer priorities.....                                   | 26        |
| <b>10 EasyDMA.....</b>                                               | <b>27</b> |
| 10.1 EasyDMA array list.....                                         | 28        |
| <b>11 NVMC — Non-volatile memory controller.....</b>                 | <b>29</b> |
| 11.1 Writing to Flash.....                                           | 29        |
| 11.2 Erasing a page in Flash.....                                    | 29        |
| 11.3 Writing to user information configuration registers (UICR)..... | 29        |
| 11.4 Erasing user information configuration registers (UICR).....    | 29        |
| 11.5 Erase all.....                                                  | 30        |
| 11.6 Cache.....                                                      | 30        |
| 11.7 Registers.....                                                  | 30        |
| 11.8 Electrical specification.....                                   | 33        |
| <b>12 BPROT — Block protection.....</b>                              | <b>34</b> |
| 12.1 Registers.....                                                  | 34        |
| <b>13 FICR — Factory information configuration registers.....</b>    | <b>43</b> |
| 13.1 Registers.....                                                  | 43        |
| <b>14 UICR — User information configuration registers.....</b>       | <b>54</b> |
| 14.1 Registers.....                                                  | 54        |
| <b>15 Peripheral interface.....</b>                                  | <b>68</b> |
| 15.1 Peripheral ID.....                                              | 68        |
| 15.2 Peripherals with shared ID.....                                 | 68        |
| 15.3 Peripheral registers.....                                       | 69        |
| 15.4 Bit set and clear.....                                          | 69        |
| 15.5 Tasks.....                                                      | 69        |
| 15.6 Events.....                                                     | 70        |
| 15.7 Shortcuts.....                                                  | 70        |
| 15.8 Interrupts.....                                                 | 70        |

|                                                           |            |

| February 2016  | 1.0     | First release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 2 About this document

This Product Specification is organized into chapters based on the modules and peripherals that are available in this IC.

The peripheral descriptions are broken into separate sections that include the following information:

- A detailed functional description of the peripheral.
- Register configuration for the peripheral
- Electrical specification tables providing the specified limits of the chip when tested under the conditions defined in the [Recommended operating conditions](#) on page 20

### 2.1 Peripheral naming and abbreviations

Every peripheral has a unique capitalized name or an abbreviation of its name, e.g. TIMER, used for identification and reference. This name is used in chapter headings and references, and it will appear in the ARM® Cortex® Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer to identify the peripheral.

The peripheral instance name, which is different from the peripheral name, is constructed using the peripheral name followed by a numbered postfix, starting with 0, for example, TIMER0. A postfix is normally only used if a peripheral can be instantiated more than once. The peripheral instance name is also used in the CMSIS to identify the peripheral instance.

### 2.2 Register tables

Individual registers are described using register tables. These tables are built up of two sections. The first three colored rows describe the position and size of the different fields in the register. The following rows describe the fields in more detail.

#### 2.2.1 Fields and values

The **Id (Field Id)** row specifies the bits that belong to the different fields in the register.

A blank space means that the field is reserved and that it is read as undefined, and must be written as '0' to secure forward compatibility. If a register is divided into more than one field, a unique field name is specified for each field in the **Field** column.

If a field has enumerated values, then every value will be identified with a unique value id in the **Value Id** column. Single-bit bit fields may, however, omit the **Value Id** when values can be substituted with a Boolean type enumerator range, for example, True/False, Disable/Enable, On/Off, and so on.

Values are usually provided as decimal or hexadecimal. Hex values have a '0x' prefix, decimal values have no prefix.

The **Value** column can be populated in the following ways:

- Individual enumerated values, for example, 1, 3, 9.
- Range of values, e.g. [0..4], that is, all values from and including 0 and 4.
- Implicit values. If no values are indicated in the **Value** column, all bit combinations are supported, or alternatively the field's translation and limitations are described in the text instead.

If two or more fields are closely related, the **Value Id**, **Value**, and **Description** may be omitted for all but the first field. Subsequent fields will indicate inheritance with “..”.

When an item is marked with the word **Deprecated**, it means this is an attribute applied to a feature to indicate that it should not be used for new designs.

## 2.3 Registers

**Table 1: Register Overview**

| Register     | Offset | Description                                       |
|--------------|--------|---------------------------------------------------|
| <i>DUMMY</i> | 0x514  | Example of a register controlling a dummy feature |

### 2.3.1 DUMMY

Address offset: 0x514

Example of a register controlling a dummy feature

|                  |    |         |              |    |    |    |        |    |    |    |                                                               |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |   |  |  |            |  |  |  |

## 3 Block diagram

This block diagram illustrates the overall system. Arrows with white heads indicate signals that share physical pins with other signals.

Figure 1: Block diagram

## 4 Pin assignments

Here we cover the pin assignments for each variant of the chip.

### 4.1 QFN48 pin assignments

Figure 2: QFN48 pin assignments, top view

Table 2: QFN48 pin assignments

| Pin               | Name  | Type         | Description                               |
|-------------------|-------|--------------|-------------------------------------------|
| Left Side of chip |       |              |                                           |
| 1                 | DEC1  | Power        | 0.9 V regulator digital supply decoupling |
| 2                 | P0.00 | Digital I/O  | General purpose I/O                       |
| 3                 | XL1   | Analog input | Connection for 32.768 kHz crystal (LFXO)  |
|                   | P0.01 | Digital I/O  | General purpose I/O                       |
| 4                 | XL2   | Analog input | Connection for 32.768 kHz crystal (LFXO)  |
|                   | P0.02 | Digital I/O  | General purpose I/O                       |
| 5                 | AIN0  | Analog input | SAADC/COMP/LPCOMP input                   |
|                   | P0.03 | Digital I/O  | General purpose I/O                       |
| 6                 | AIN1  | Analog input | SAADC/COMP/LPCOMP input                   |
|                   | P0.04 | Digital I/O  | General purpose I/O                       |
| 7                 | AIN2  | Analog input | SAADC/COMP/LPCOMP input                   |
|                   | P0.05 | Digital I/O  | General purpose I/O                       |
| 8                 | AIN3  | Analog input | SAADC/COMP/LPCOMP input                   |
|                   | P0.06 | Digital I/O  | General purpose I/O                       |
| 9                 | P0.07 | Digital I/O  | General purpose I/O                       |

| Pin                        | Name               | Type          | Description                                             |

## 4.3 GPIO usage restrictions

### 4.3.1 GPIO located near the radio

Radio performance parameters, such as sensitivity, may be affected by high frequency digital I/O with large sink/source current close to the Radio power supply and antenna pins.

[Table 4: GPIO recommended usage for QFN48 package](#) on page 17 and [Table 5: GPIO recommended usage for WLCSP package](#) on page 17 identify some GPIO that have recommended usage guidelines to maximize radio performance in an application.

**Table 4: GPIO recommended usage for QFN48 package**

| Pin | GPIO  | Recommended usage                  |
|-----|-------|------------------------------------|
| 27  | P0.22 | Low drive, low frequency I/O only. |
| 28  | P0.23 |                                    |
| 29  | P0.24 |                                    |
| 37  | P0.25 |                                    |
| 38  | P0.26 |                                    |
| 39  | P0.27 |                                    |
| 40  | P0.28 |                                    |
| 41  | P0.29 |                                    |
| 42  | P0.30 |                                    |
| 43  | P0.31 |                                    |

**Table 5: GPIO recommended usage for WLCSP package**

| Pin | GPIO  | Recommended usage                  |
|-----|-------|------------------------------------|
| F2  | P0.22 | Low drive, low frequency I/O only. |
| E2  | P0.23 |                                    |
| E1  | P0.24 |                                    |
| B3  | P0.25 |                                    |
| D3  | P0.26 |                                    |
| B4  | P0.27 |                                    |
| A3  | P0.28 |                                    |
| A4  | P0.29 |                                    |
| A5  | P0.30 |                                    |
| B5  | P0.31 |                                    |

### 4.3.2 NFC antenna pins

Two physical pins can be configured either as NFC antenna pins (factory default), or as GPIOs, as shown below.

**Table 6: GPIO pins used by NFC**

| NFC pad name | GPIO  |
|--------------|-------|
| NFC1         | P0.09 |
| NFC2         | P0.10 |

When configured as NFC antenna pins, the GPIOs on those pins will automatically be set to DISABLE state and a protection circuit will be enabled preventing the chip from being damaged in the presence of a strong NFC field. The protection circuit will short the two pins together if voltage difference exceeds approximately 2 V.

<sup>3</sup> See [GPIO located near the radio](#) on page 17 for more information.

<sup>4</sup> See [NFC antenna pins](#) on page 17 for more information.

For information on how to configure these pins as normal GPIOs, see [NFCT — Near field communication tag](#) on page 417 and [UICR — User information configuration registers](#) on page 54. Note that the device will not be protected against strong NFC field damage if the pins are configured as GPIO and an NFC antenna is connected to the device. The pins will always be configured as NFC pins during power-on reset until the configuration is set according to the UICR register.

These two pins will have some limitations when configured as GPIO. The pin capacitance will be higher on these pins, and there is some current leakage between the two pins if they are driven to different logical values. To avoid leakage between the pins when configured as GPIO, these GPIOs should always be at the same logical value whenever entering one of the device power saving modes. See [Electrical specification](#).

## 5 Absolute maximum ratings

Maximum ratings are the extreme limits to which the chip can be exposed for a limited amount of time without permanently damaging it. Exposure to absolute maximum ratings for prolonged periods of time may affect the reliability of the device.

**Table 7: Absolute maximum ratings**

|                                                | Min.             | Max.        | Unit               |
|------------------------------------------------|------------------|-------------|--------------------|
| <b>Supply voltages</b>                         |                  |             |                    |
| VDD                                            | -0.3             | +3.9        | V                  |

## 6 Recommended operating conditions

The operating conditions are the physical parameters that the chip can operate within.

**Table 8: Recommended operating conditions**

| Symbol             | Parameter                                  | Notes | Min. | Nom. | Max. | Units |
|--------------------|--------------------------------------------|-------|------|------|------|-------|
| VDD                | Supply voltage, independent of DCDC enable |       | 1.7  | 3.0  | 3.6  | V     |
| t <sub>R_VDD</sub> | Supply rise time (0 V to 1.7 V)            |       |      |      | 60   | ms    |
| TA                 | Operating temperature                      |       | -40  | 25   | 85   | °C    |

**Important:** The on-chip power-on reset circuitry may not function properly for rise times longer than the specified maximum.

## 7 CPU

The ARM® Cortex®-M4 processor with floating-point unit (FPU) has a 32-bit instruction set (Thumb®-2 technology) that implements a superset of 16 and 32-bit instructions to maximize code density and performance.

This processor implements several features that enable energy-efficient arithmetic and high-performance signal processing including:

- Digital signal processing (DSP) instructions
- Single-cycle multiply and accumulate (MAC) instructions
- Hardware divide
- 8 and 16-bit single instruction multiple data (SIMD) instructions
- Single-precision floating-point unit (FPU)

The ARM Cortex Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer for the ARM Cortex processor series is implemented and available for the M4 CPU.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the Nested Vectored Interrupt Controller (NVIC).

Executing code from flash will have a wait state penalty on the nRF52 Series. An instruction cache can be enabled to minimize flash wait states when fetching instructions. For more information on cache, see [Cache](#) on page 30. The section [Electrical specification](#) on page 21 shows CPU performance parameters including wait states in different modes, CPU current and efficiency, and processing power and efficiency based on the CoreMark® benchmark.

### 7.1 Floating point interrupt

The floating point unit (FPU) may generate exceptions when used due to e.g. overflow or underflow. These exceptions will trigger the FPU interrupt (see [Instantiation](#) on page 24). To clear the IRQ line when an exception has occurred, the relevant exception bit within the FPSCR register needs to be cleared. For more information about the FPSCR or other FPU registers, see *Cortex-M4 Devices Generic User Guide*.

## 7.2 Electrical specification

### 7.2.1 CPU performance

The CPU clock speed is 64 MHz. Current and efficiency data is taken when in System ON and the CPU is executing the CoreMark™ benchmark. It includes power regulator and clock base currents. All other blocks are IDLE.

| Symbol                       | Description                                                | Min. | Typ. | Max. | Units      |
|------------------------------|------------------------------------------------------------|------|------|------|------------|

| CM <sub>FLASH/mA</sub>  | CoreMark per mA, running from flash, cache enabled, DCDC 3V |      | 58   |      | CoreM<br>mA  |

## 7.3 CPU and support module configuration

The ARM® Cortex®-M4 processor has a number of CPU options and support modules implemented on the device.

| Option / Module | Description                        | Implemented   |
|-----------------|------------------------------------|---------------|
| Core options    |                                    |               |
| NVIC            | Nested Vector Interrupt Controller | 37 vectors    |
| PRIORITIES      | Priority bits                      | 3             |
| WIC             | Wakeup Interrupt Controller        | NO            |
| Endianness      | Memory system endianness           | Little endian |
| Bit Banding     | Bit banded memory                  | NO            |
| DWT             | Data Watchpoint and Trace          | YES           |
| SysTick         | System tick timer                  | YES           |
| Modules         |                                    |               |
| MPU             | Memory protection unit             | YES           |
| FPU             | Floating point unit                | YES           |
| DAP             | Debug Access Port                  | YES           |
| ETM             | Embedded Trace Macrocell           | YES           |
| ITM             | Instrumentation Trace Macrocell    | YES           |
| TPIU            | Trace Port Interface Unit          | YES           |
| ETB             | Embedded Trace Buffer              | NO            |
| FPB             | Flash Patch and Breakpoint Unit    | YES           |
| HTM             | AHB Trace Macrocell                | NO            |

<sup>5</sup> Using IAR v6.50.1.4452 with flags --endian=little --cpu=Cortex-M4 -e --fpu=VFPv4\_sp -Ohs --no\_size\_constraints

## 8 Memory

The nRF52832 contains flash and RAM that can be used for code and data storage.

The amount of RAM and flash will vary depending on variant, see [Table 9: Memory variants](#) on page 23.

**Table 9: Memory variants**

| Device name   | RAM   | Flash  | Comments |
|---------------|-------|--------|----------|
| nRF52832-QFAA | 64 kB | 512 kB |          |
| nRF52832-QFAB | 32 kB | 256 kB |          |
| nRF52832-CIAA | 64 kB | 512 kB |          |

The CPU and the EasyDMA can access memory via the AHB multilayer interconnect. The CPU is also able to access peripherals via the AHB multilayer interconnect, as illustrated in [Figure 4: Memory layout](#) on page 23.

**Figure 4: Memory layout**

See [AHB multilayer](#) on page 26 and [EasyDMA](#) on page 27 for more information about the AHB multilayer interconnect and the EasyDMA.

The same physical RAM is mapped to both the Data RAM region and the Code RAM region. It is up to the application to partition the RAM within these regions so that one does not corrupt the other.

### 8.1 RAM - Random access memory

The RAM interface is divided into multiple RAM AHB slaves.

Each RAM AHB slave is connected to two 4-kilobyte RAM sections, see Section 0 and Section 1 in [Figure 4: Memory layout](#) on page 23.

Each of the RAM sections have separate power control for System ON and System OFF mode operation, which is configured via RAM register (see the [POWER — Power supply](#) on page 78).

## 8.2 Flash - Non-volatile memory

The Flash can be read an unlimited number of times by the CPU, but it has restrictions on the number of times it can be written and erased and also on how it can be written.

Writing to Flash is managed by the Non-volatile memory controller (NVMC), see [NVMC — Non-volatile memory controller](#) on page 29.

The Flash is divided into multiple pages that can be accessed by the CPU via both the ICODE and DCODE buses as shown in, [Figure 4: Memory layout](#) on page 23. Each page is divided into 8 blocks.

## 8.3 Memory map

The complete memory map is shown in [Figure 5: Memory map](#) on page 24. As described in [Memory](#) on page 23, Code RAM and the Data RAM are the same physical RAM.

Figure 5: Memory map

## 8.4 Instantiation

Table 10: Instantiation table

| ID | Base Address | Peripheral | Instance | Description                                              |            |
|----|--------------|------------|----------|----------------------------------------------------------|------------|
| 0  | 0x40000000   | CLOCK      | CLOCK    | Clock control                                            |            |
| 0  | 0x40000000   | POWER      | POWER    | Power control                                            |            |
| 0  | 0x40000000   | BPROT      | BPROT    | Block Protect                                            |            |
| 1  | 0x40001000   | RADIO      | RADIO    | 2.4 GHz radio                                            |            |
| 2  | 0x40002000   | UARTE      | UARTE0   | Universal Asynchronous Receiver/Transmitter with EasyDMA |            |

## 9 AHB multilayer

The CPU and all of the EasyDMAs are AHB bus masters on the AHB multilayer, while the RAM and various other modules are AHB slaves.

See [Block diagram](#) on page 12 for an overview of which peripherals implement EasyDMA.

The CPU has exclusive access to all AHB slaves except for the RAM that can also be accessed by the EasyDMA.

Access rights to each of the RAM AHB slaves are resolved using the priority of the different bus masters in the system

See [AHB multilayer priorities](#) on page 26 for information about the priority of the different AHB bus masters in the system. It is possible for two or more bus masters to have the same priority in cases where it is guaranteed by design that the related masters will never be able to access the same slave at the same time.

### 9.1 AHB multilayer priorities

Each master connected to the AHB multilayer is assigned a priority.

**Table 11: AHB bus masters**

| Bus master name | Priority         | Description                           |
|-----------------|------------------|---------------------------------------|
| CPU             | Highest priority |                                       |
| SPIS1           |                  | Applies to SPIM1, SPIS1, TWIM1, TWIS1 |
| RADIO           |                  |                                       |
| CCM/ECB/AAR     |                  |                                       |
| SAADC           |                  |                                       |
| UARTE           |                  |                                       |
| SERIAL0         |                  | Applies to SPIM0, SPIS0, TWIM0, TWIS0 |
| SERIAL2         |                  | Applies to SPIM2, SPIS2               |
| NFCT            |                  |                                       |
| I2S             |                  | I2S                                   |
| PDM             |                  | PDM                                   |
| PWM             | Lowest priority  | Applies to PWM0, PWM1, PWM2           |

## 10 EasyDMA

EasyDMA is an easy-to-use direct memory access module that some peripherals implement to gain direct access to Data RAM.

The EasyDMA is an AHB bus master similar to the CPU and it is connected to the AHB multilayer interconnect for direct access to the Data RAM. The EasyDMA is not able to access the Flash.

A peripheral can implement multiple EasyDMA instances, for example to provide a dedicated channel for reading data from RAM into the peripheral at the same time as a second channel is dedicated for writing data to the RAM from the peripheral. This concept is illustrated in [Figure 6: EasyDMA example](#) on page 27

**Figure 6: EasyDMA example**

An EasyDMA channel is usually exposed to the user in the form illustrated below, but some variations may occur:

```

READERBUFFER_SIZE 5
WRITERBUFFER_SIZE 6

uint8_t readerBuffer[READERBUFFER_SIZE] __at__ 0x20000000;
uint8_t writerBuffer[WRITERBUFFER_SIZE] __at__ 0x20000005;

// Configuring the READER channel
MYPERIPHERAL->READER.MAXCNT = READERBUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &readerBuffer;

// Configure the WRITER channel
MYPERIPHERAL->WRITER.MAXCNT = WRITERBUFFER_SIZE;
MYPERIPHERAL->WRITER.PTR = &writerBuffer;

```

This example shows a peripheral called MYPERIPHERAL that implements two EasyDMA channels, one for reading, called READER, and one for writing, called WRITER. When the peripheral is started, it is here assumed that the peripheral will read 5 bytes from the readerBuffer located in RAM at address 0x20000000, process the data and then write no more than 6 bytes back to the writerBuffer located in RAM at address 0x20000005. The memory layout of these buffers is illustrated in [Figure 7: EasyDMA memory layout](#) on page 28.

|            |                 |                 |                 |                 |
|------------|-----------------|-----------------|-----------------|-----------------|
| 0x20000000 | readerBuffer[0] | readerBuffer[1] | readerBuffer[2] | readerBuffer[3] |
| 0x20000004 | readerBuffer[4] | writerBuffer[0] | writerBuffer[1] | writerBuffer[2] |
| 0x20000008 | writerBuffer[3] | writerBuffer[4] | writerBuffer[5] |                 |

**Figure 7: EasyDMA memory layout**

The EasyDMA channel's MAXCNT register cannot be specified larger than the actual size of the buffer. If, for example, the WRITER.MAXCNT register is specified larger than the size of the writerBuffer, the WRITER EasyDMA channel may overflow the writerBuffer.

After the peripheral has completed the EasyDMA transfer, the CPU can read the EasyDMA channel's AMOUNT register to see how many bytes that were transferred, e.g. it is possible for the CPU to read the MYPERIPHERAL->WRITER.AMOUNT register to see how many bytes the WRITER wrote to RAM.

## 10.1 EasyDMA array list

The EasyDMA is able to operate in a mode called array list.

The EasyDMA array list can be represented by the data structure ArrayList\_type illustrated in the code example below.

This data structure includes only a buffer with size equal to READER.MAXCNT. EasyDMA will use the READER.MAXCNT register to determine when the buffer is full.

This array list does not provide a mechanism to explicitly specify where the next item in the list is located. Instead, it assumes that the list is organized as a linear array where items are located one after the other in RAM.

```
#define BUFFER_SIZE 4

typedef struct ArrayList
{
    uint8_t buffer[BUFFER_SIZE];
} ArrayList_type;

ArrayList_type ReaderList[3];

READER.MAXCNT = BUFFER_SIZE;
READER.PTR = &ReaderList;
```

**Figure 8: EasyDMA array list**

## 11 NVMC — Non-volatile memory controller

The Non-volatile memory controller (NVMC) is used for writing and erasing the internal Flash memory and the UICR.

Before a write can be performed, the NVMC must be enabled for writing in CONFIG.WEN. Similarly, before an erase can be performed, the NVMC must be enabled for erasing in CONFIG.EEN, see [CONFIG](#) on page 31. The user must make sure that writing and erasing are not enabled at the same time. Failing to do so may result in unpredictable behavior.

### 11.1 Writing to Flash

When writing is enabled, the Flash is written by writing a full 32-bit word to a word-aligned address in the Flash.

The NVMC is only able to write '0' to bits in the Flash that are erased, that is, set to '1'. It cannot write back a bit to '1'.

As illustrated in [Memory](#) on page 23, the Flash is divided into multiple pages that are further divided into multiple blocks. The same block in the Flash can only be written  $n_{WRITE}$  number of times before an erase must be performed using [ERASEPAGE](#) or [ERASEALL](#). See the memory size and organization in [Memory](#) on page 23 for block size.

Only full 32-bit words can be written to Flash using the NVMC interface. To write less than 32 bits to Flash, write the data as a word, and set all the bits that should remain unchanged in the word to '1'. Note that the restriction about the number of writes (see above) still applies in this case.

The time it takes to write a word to the Flash is specified by  $t_{WRITE}$ . The CPU is halted while the NVMC is writing to the Flash.

Only word-aligned writes are allowed. Byte or half-word-aligned writes will result in a hard fault.

### 11.2 Erasing a page in Flash

When erase is enabled, the Flash can be erased page by page using the ERASEPAGE register.

After erasing a Flash page, all bits in the page are set to '1'. The time it takes to erase a page is specified by  $t_{ERASEPAGE}$ . The CPU is halted while the NVMC performs the erase operation.

### 11.3 Writing to user information configuration registers (UICR)

User information configuration registers (UICR) are written in the same way as Flash. After UICR has been written, the new UICR configuration will only take effect after a reset.

UICR can only be written  $n_{WRITE}$  number of times before an erase must be performed using [ERASEUICR](#) or [ERASEALL](#).

The time it takes to write a word to the UICR is specified by  $t_{WRITE}$ . The CPU is halted while the NVMC is writing to the UICR.

### 11.4 Erasing user information configuration registers (UICR)

When erase is enabled, UICR can be erased using the ERASEUICR register.

After erasing UICR all bits in UICR are set to '1'. The time it takes to erase UICR is specified by  $t_{ERASEPAGE}$ . The CPU is halted while the NVMC performs the erase operation.

## 11.5 Erase all

When erase is enabled, the whole Flash and UICR can be erased in one operation by using the ERASEALL register. ERASEALL will not erase the factory information configuration registers (FICR).

The time it takes to perform an ERASEALL command is specified by  $t_{ERASEALL}$ . The CPU is halted while the NVMC performs the erase operation.

## 11.6 Cache

An instruction cache (I-Cache) can be enabled for the ICODE bus in the NVMC.

See the Memory map in [Memory map](#) on page 24 for the location of Flash.

A cache hit is an instruction fetch from the cache, and it has a 0 wait-state delay. The number of wait-states for a cache miss, where the instruction is not available in the cache and needs to be fetched from Flash, depends on the processor frequency and is shown in [CPU](#) on page 21.

Enabling the cache can increase CPU performance and reduce power consumption by reducing the number of wait cycles and the number of flash accesses. This will depend on the cache hit rate. Cache will use some current when enabled. If the reduction in average current due to reduced flash accesses is larger than the cache power requirement, the average current to execute the program code will reduce.

When disabled, the cache does not use current and does not retain its content.

It is possible to enable cache profiling to analyze the performance of the cache for your program using the [ICACHECNF](#) register. When profiling is enabled, the [IHIT](#) and [IMISS](#) registers are incremented for every instruction cache hit or miss respectively. The hit and miss profiling registers do not wrap around after reaching the maximum value. If the maximum value is reached, consider profiling for a shorter duration to get correct numbers.

## 11.7 Registers

Table 12: Instances

| Base address | Peripheral | Instance | Description                    | Configuration |
|--------------|------------|----------|--------------------------------|---------------|
| 0x4001E000   | NVMC       | NVMC     | Non-Volatile Memory Controller |               |

Table 13: Register Overview

| Register                  | Offset | Description                                                        |            |
|---------------------------|--------|--------------------------------------------------------------------|------------|
| <a href="#">READY</a>     | 0x400  | Ready flag                                                         |            |
| <a href="#">CONFIG</a>    | 0x504  | Configuration register                                             |            |
| <a href="#">ERASEPAGE</a> | 0x508  | Register for erasing a page in Code area                           |            |
| <a href="#">ERASEPCR1</a> | 0x508  | Register for erasing a page in Code area. Equivalent to ERASEPAGE. | Deprecated |
| <a href="#">ERASEALL</a>  | 0x50C  | Register for erasing all non-volatile user memory                  |            |
| <a href="#">ERASEPCRO</a> | 0x510  | Register for erasing a page in Code area. Equivalent to ERASEPAGE. | Deprecated |
| <a href="#">ERASEUICR</a> | 0x514  | Register for erasing User Information Configuration Registers      |            |
| <a href="#">ICACHECNF</a> | 0x540  | I-Code cache configuration register.                               |            |
| <a href="#">IHIT</a>      | 0x548  | I-Code cache hit counter.                                          |            |
| <a href="#">IMISS</a>     | 0x54C  | I-Code cache miss counter.                                         |            |

### 11.7.1 READY

Address offset: 0x400

Ready flag

 |------------------------------|-------------------|------|------|------|-------|
| $\text{Size}_{\text{ICODE}}$ | I-Code cache size |      | 2048 |      | Bytes |

## 12 BPROT — Block protection

The mechanism for protecting non-volatile memory can be used to prevent application code from erasing or writing to protected blocks.

Non-volatile memory can be protected from erases and writes depending on the settings in the CONFIG registers. One bit in a CONFIG register represents one protected block of 4 kB. There are four CONFIG registers of 32 bits, which means there are 128 protectable blocks in total.

**Important:** If an erase or write to a protected block is detected, the CPU will hard fault. If an ERASEALL operation is attempted from the CPU while any block is protected, it will be blocked and the CPU will hard fault.

On reset, all the protection bits are cleared. To ensure safe operation, the first task after reset must be to set the protection bits. The only way of clearing protection bits is by resetting the device from any reset source.

The protection mechanism is turned off when in debug interface mode (a debugger is connected) and the DISABLEINDEBUG register is set to disable. For more information, see [Debug and trace](#) on page 72.

Figure 9: Protected regions of program memory

### 12.1 Registers

Table 14: Instances

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40000000   | BPROT      | BPROT    | Block Protect |               |

Table 15: Register Overview

| Register                       | Offset | Description                                          |
|--------------------------------|--------|------------------------------------------------------|
| <a href="#">CONFIG0</a>        | 0x600  | Block protect configuration register 0               |
| <a href="#">CONFIG1</a>        | 0x604  | Block protect configuration register 1               |
| <a href="#">DISABLEINDEBUG</a> | 0x608  | Disable protection mechanism in debug interface mode |
|                                | 0x60C  | Reserved                                             |

## 13 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory and cannot be erased by the user. These registers contain chip-specific information and configuration.

### 13.1 Registers

Table 16: Instances

| Base address | Peripheral | Instance | Description                       | Configuration |
|--------------|------------|----------|-----------------------------------|---------------|
| 0x10000000   | FICR       | FICR     | Factory Information Configuration |               |

Table 17: Register Overview

## 14 UICR — User information configuration registers

The user information configuration registers (UICRs) are non-volatile memory (NVM) registers for configuring user specific settings.

For information on writing UICR registers, see the [NVMC — Non-volatile memory controller](#) on page 29 and [Memory](#) on page 23 chapters.

### 14.1 Registers

**Table 18: Instances**

| Base address | Peripheral | Instance | Description                    | Configuration |
|--------------|------------|----------|--------------------------------|---------------|
| 0x10001000   | UICR       | UICR     | User Information Configuration |               |

**Table 19: Register Overview**

| Register                    | Offset | Description                         |
|-----------------------------|--------|-------------------------------------|
|                             | 0x000  | Reserved                            |

### 14.1.60 PSELRESET[0]

Address offset: 0x200

Mapping of the nRESET function (see POWER chapter for details)

All PSELRESET registers have to contain the same value for a pin mapping to be valid. If they don't, there will be no nRESET function exposed on a GPIO, and the device will always start independently of the levels present on any of the GPIOs.

### 14.1.61 PSELRESET[1]

Address offset: 0x204

Mapping of the nRESET function (see POWER chapter for details)

All PSELRESET registers have to contain the same value for a pin mapping to be valid. If they don't, there will be no nRESET function exposed on a GPIO, and the device will always start independently of the levels present on any of the GPIOs.

## 15 Peripheral interface

Peripherals are controlled by the CPU by writing to configuration registers and task registers. Peripheral events are indicated to the CPU by event registers and interrupts if they are configured for a given event.

**Figure 10: Tasks, events, shortcuts, and interrupts**

### 15.1 Peripheral ID

Every peripheral is assigned a fixed block of 0x1000 bytes of address space, which is equal to 1024 x 32 bit registers.

See [Instantiation](#) on page 24 for more information about which peripherals are available and where they are located in the address map.

There is a direct relationship between the peripheral ID and base address. For example, a peripheral with base address 0x40000000 is assigned ID=0, a peripheral with base address 0x40001000 is assigned ID=1, and a peripheral with base address 0x4001F000 is assigned ID=31.

Peripherals may share the same ID, which may impose one or more of the following limitations:

- Some peripherals share some registers or other common resources.
- Operation is mutually exclusive. Only one of the peripherals can be used at a time.
- Switching from one peripheral to another must follow a specific pattern (disable the first, then enable the second peripheral).

### 15.2 Peripherals with shared ID

In general, and with the exception of ID 0, peripherals sharing an ID and base address may not be used simultaneously. The user can only enable one at the time on this specific ID.

When switching between two peripherals that share an ID, the user should do the following to prevent unwanted behavior:

- Disable the previously used peripheral

- Remove any PPI connections set up for the peripheral that is being disabled
- Clear all bits in the INTEN register, i.e. INTENCLR = 0xFFFFFFFF.
- Explicitly configure the peripheral that you enable and do not rely on configuration values that may be inherited from the peripheral that was disabled.
- Enable the now configured peripheral.

For each of the rows in the following table, the instance ID listed is shared by the peripherals in the same row.

**Table 20: Peripherals sharing an ID**

| Instance           |       |        |     |      |      |     |
|--------------------|-------|--------|-----|------|------|-----|
| ID 2 (0x40002000)  | UARTE | UART   |     |      |      |     |
| -                  |       |        |     |      |      |     |
| ID 3 (0x40003000)  | SPIM  | SPIS   | SPI | TWIM | TWIS | TWI |
| ID 4 (0x40004000)  | SPIM  | SPIS   | SPI | TWIM | TWIS | TWI |
| ID 35 (0x40023000) | SPIM  | SPIS   | SPI |      |      |     |
| -                  |       |        |     |      |      |     |
| ID 15 (0x4000F000) | AAR   | CCM    |     |      |      |     |
| -                  |       |        |     |      |      |     |
| ID 19 (0x40013000) | COMP  | LPCOMP |     |      |      |     |
| -                  |       |        |     |      |      |     |
| ID 20 (0x40014000) | SWI   | EGU    |     |      |      |     |
| ID 21 (0x40015000) | SWI   | EGU    |     |      |      |     |
| ID 22 (0x40016000) | SWI   | EGU    |     |      |      |     |
| ID 23 (0x40017000) | SWI   | EGU    |     |      |      |     |
| ID 24 (0x40018000) | SWI   | EGU    |     |      |      |     |
| ID 25 (0x40019000) | SWI   | EGU    |     |      |      |     |

## 15.3 Peripheral registers

Most peripherals feature an ENABLE register. Unless otherwise specified in the relevant chapter, the peripheral registers (in particular the PSEL registers) must be configured before enabling the peripheral.

Note that the peripheral must be enabled before tasks and events can be used.

## 15.4 Bit set and clear

Registers with multiple single-bit fields may implement the "set-and-clear" pattern. This pattern enables firmware to set and clear individual bits in a register without having to perform a read-modify-write operation on the main register.

This pattern is implemented using three consecutive addresses in the register map where the main register is followed by a dedicated SET and CLR register in that order.

The SET register is used to set individual bits in the main register while the CLR register is used to clear individual bits in the main register. Writing a '1' to a bit in the SET or CLR register will set or clear the same bit in the main register respectively. Writing a '0' to a bit in the SET or CLR register has no effect. Reading the SET or CLR registers returns the value of the main register.

**Restriction:** The main register may not be visible and hence not directly accessible in all cases.

## 15.5 Tasks

Tasks are used to trigger actions in a peripheral, for example, to start a particular behavior. A peripheral can implement multiple tasks with each task having a separate register in that peripheral's task register group.

A task is triggered when firmware writes a '1' to the task register or when the peripheral itself or another peripheral toggles the corresponding task signal. See [Figure 10: Tasks, events, shortcuts, and interrupts](#) on page 68.

## 15.6 Events

Events are used to notify peripherals and the CPU about events that have happened, for example, a state change in a peripheral. A peripheral may generate multiple events with each event having a separate register in that peripheral's event register group.

An event is generated when the peripheral itself toggles the corresponding event signal, and the event register is updated to reflect that the event has been generated. See [Figure 10: Tasks, events, shortcuts, and interrupts](#) on page 68. An event register is only cleared when firmware writes a '0' to it.

Events can be generated by the peripheral even when the event register is set to '1'.

## 15.7 Shortcuts

A shortcut is a direct connection between an event and a task within the same peripheral. If a shortcut is enabled, its associated task is automatically triggered when its associated event is generated.

Using a shortcut is the equivalent to making the same connection outside the peripheral and through the PPI. However, the propagation delay through the shortcut is usually shorter than the propagation delay through the PPI.

Shortcuts are predefined, which means their connections cannot be configured by firmware. Each shortcut can be individually enabled or disabled through the shortcut register, one bit per shortcut, giving a maximum of 32 shortcuts for each peripheral.

## 15.8 Interrupts

All peripherals support interrupts. Interrupts are generated by events.

A peripheral only occupies one interrupt, and the interrupt number follows the peripheral ID. For example, the peripheral with ID=4 is connected to interrupt number 4 in the Nested Vectored Interrupt Controller (NVIC).

Using the INTEN, INTENSET and INTENCLR registers, every event generated by a peripheral can be configured to generate that peripheral's interrupt. Multiple events can be enabled to generate interrupts simultaneously. To resolve the correct interrupt source, the event registers in the event group of peripheral registers will indicate the source.

Some peripherals implement only INTENSET and INTENCLR, and the INTEN register is not available on those peripherals. Refer to the individual chapters for details. In all cases, however, reading back the INTENSET or INTENCLR register returns the same information as in INTEN.

Each event implemented in the peripheral is associated with a specific bit position in the INTEN, INTENSET and INTENCLR registers.

The relationship between tasks, events, shortcuts, and interrupts is shown in [Figure 10: Tasks, events, shortcuts, and interrupts](#) on page 68.

### 15.8.1 Interrupt clearing

When clearing an interrupt by writing "0" to an event register, or disabling an interrupt using the INTENCLR register, it can take up to four CPU clock cycles to take effect. This means that an interrupt may reoccur immediately even if a new event has not come, if the program exits an interrupt handler after the interrupt is cleared or disabled, but before four clock cycles have passed.

**Important:** To avoid an interrupt reoccurring before a new event has come, the program should perform a read from one of the peripheral registers, for example, the event register that has been cleared, or the INTENCLR register that has been used to disable the interrupt.

This will cause a one to three-cycle delay and ensure the interrupt is cleared before exiting the interrupt handler. Care should be taken to ensure the compiler does not remove the read operation as an optimization. If the program can guarantee a four-cycle delay after event clear or interrupt disable another way, then a read of a register is not required.

## 16 Debug and trace

The debug and trace system offers a flexible and powerful mechanism for non-intrusive debugging.

**Figure 11: Debug and trace overview**

The main features of the debug and trace system are:

- Two-pin Serial Wire Debug (SWD) interface
- Flash Patch and Breakpoint Unit (FPB) supports:
  - Two literal comparators
  - Six instruction comparators
- Data Watchpoint and Trace Unit (DWT)
  - Four comparators
- Instrumentation Trace Macrocell (ITM)
- Embedded Trace Macrocell (ETM)
- Trace Port Interface Unit (TPIU)
  - 4-bit parallel trace of ITM and ETM trace data
  - Serial Wire Output (SWO) trace of ITM data

### 16.1 DAP - Debug Access Port

An external debugger can access the device via the DAP.

The DAP implements a standard ARM® CoreSight™ Serial Wire Debug Port (SW-DP).

The SW-DP implements the Serial Wire Debug protocol (SWD) that is a two-pin serial interface, see SWDCLK and SWDIO in [Figure 11: Debug and trace overview](#) on page 72.

In addition to the default access port in the CPU (AHB-AP), the DAP includes a custom Control Access Port (CTRL-AP). The CTRL-AP is described in more detail in [CTRL-AP - Control Access Port](#) on page 73.

#### Important:

- The SWDIO line has an internal pull-up resistor.
- The SWDCLK line has an internal pull-down resistor.

## 16.2 CTRL-AP - Control Access Port

The Control Access Port (CTRL-AP) is a custom access port that enables control of the device even if the other access ports in the DAP are being disabled by the access port protection.

Access port protection blocks the debugger from read and write access to all CPU registers and memory-mapped addresses. See the UICR register [APPROTECT](#) on page 66 for more information about enabling access port protection.

This access port enables the following features:

- Soft reset, see [Reset](#) on page 82 for more information
- Disable access port protection

Access port protection can only be disabled by issuing an ERASEALL command via CTRL-AP. This command will erase the Flash, UICR, and RAM.

### 16.2.1 Registers

**Table 21: Register Overview**

| Register                        | Offset | Description                                |
|---------------------------------|--------|--------------------------------------------|
| <a href="#">RESET</a>           | 0x000  | Soft reset triggered through CTRL-AP       |
| <a href="#">ERASEALL</a>        | 0x004  | Erase all                                  |
| <a href="#">ERASEALLSTATUS</a>  | 0x008  | Status register for the ERASEALL operation |
| <a href="#">APPROTECTSTATUS</a> | 0x00C  | Status register for access port protection |
| <a href="#">IDR</a>             | 0x0FC  | CTRL-AP Identification Register, IDR       |

#### RESET

## 16.3 Debug interface mode

Before the external debugger can access the CPU's access port (AHB-AP) or the Control Access Port (CTRL-AP), the debugger must first request the device to power up via CxxxPWRUPREQ in the SWJ-DP.

As long as the debugger is requesting power via CxxxPWRUPREQ, the device will be in debug interface mode. If the debugger is not requesting power via CxxxPWRUPREQ, the device will be in normal mode.

Some peripherals will behave differently in debug interface mode compared to normal mode. These differences are described in more detail in the chapters of the peripherals that are affected.

When a debug session is over, the external debugger must make sure to put the device back into normal mode since the overall power consumption will be higher in debug interface mode compared to normal mode.

For details on how to use the debug capabilities please read the debug documentation of your IDE.

If the device is in System OFF when power is requested via CxxxPWRUPREQ, the system will wake up and the DIF flag in [RESETREAS](#) on page 85 will be set.

## 16.4 Real-time debug

The nRF52832 supports real-time debugging.

Real-time debugging will allow interrupts to execute to completion in real time when breakpoints are set in Thread mode or lower priority interrupts. This enables the developer to set a breakpoint and single-step through their code without a failure of the real-time event-driven threads running at higher priority. For example, this enables the device to continue to service the high-priority interrupts of an external controller or sensor without failure or loss of state synchronization while the developer steps through code in a low-priority thread.

## 16.5 Trace

The device supports ETM and ITM trace.

Trace data from the ETM and the ITM is sent to an external debugger via a 4-bit wide parallel trace port (TPIU), see TRACEDATA[0] through TRACEDATA[3] and TRACECLK in [Figure 11: Debug and trace overview](#) on page 72.

In addition to parallel trace, the TPIU supports serial trace via the Serial Wire Output (SWO) trace protocol.

Parallel and serial trace cannot be used at the same time.

ETM trace is only supported in parallel trace mode while ITM trace is supported in both parallel and serial trace modes.

For details on how to use the trace capabilities, please read the debug documentation of your IDE.

TPIU's trace pins are multiplexed with GPIOs, and SWO and TRACEDATA[0] use the same GPIO, see [Pin assignments](#) on page 13 for more information.

Trace speed is configured in the [TRACECONFIG](#) on page 108 register.

The speed of the trace pins depends on the DRIVE setting of the GPIOs that the trace pins are multiplexed with, see [PIN\\_CNF\[14\]](#) on page 142, [PIN\\_CNF\[15\]](#) on page 143, [PIN\\_CNF\[16\]](#) on page 144, [PIN\\_CNF\[18\]](#) on page 145 and [PIN\\_CNF\[20\]](#) on page 146. Only S0S1 and H0H1 drives are suitable for debugging. S0S1 is the default DRIVE at reset. If parallel or serial trace port signals are not fast enough in the debugging conditions, all GPIOs in use for tracing should be set to high drive (H0H1). The user shall make sure that these GPIOs' DRIVE is not overwritten by software during the debugging session.

### 16.5.1 Electrical specification

#### Trace port

| Symbol           | Description                                                                                                                                                     | Min. | Typ. | Max. | Units |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| T <sub>cyc</sub> | Clock period, as defined by ARM (See ARM Infocenter, Embedded Trace Macrocell Architecture Specification, Trace Port Physical Interface, Timing specifications) | 62.5 |      | 500  | ns    |

## 17 Power and clock management

Power and clock management in nRF52832 is optimized for ultra-low power applications.

The core of the power and clock management system is the Power Management Unit (PMU) illustrated in [Figure 12: Power Management Unit](#) on page 76.

**Figure 12: Power Management Unit**

The user application is not required to actively control power and clock, since the PMU is able to automatically detect which resources are required by the different components in the system at any given time. The PMU will continuously optimize the system based on this information to achieve the lowest power consumption possible without user interaction.

### 17.1 Current consumption scenarios

As the system is being constantly tuned by the PMU, estimating the energy consumption of an application can be challenging if the designer is not able to do measurements on the hardware directly. See [Electrical specification](#) on page 76 for application scenarios showing average current drawn from the VDD supply.

Each scenario specifies a set of active operations and conditions applying to the given scenario. [Table 22: Current consumption scenarios, common conditions](#) on page 76 shows the conditions used for a scenario unless otherwise is stated in the scenario description.

**Table 22: Current consumption scenarios, common conditions**

| Condition   | Value         |
|-------------|---------------|
| VDD         | 3 V           |
| Temperature | 25°C          |
| CPU         | WFI/WFE sleep |
| Peripherals | All idle      |
| Clock       | Not running   |
| Regulator   | DCDC          |

#### 17.1.1 Electrical specification

##### Current consumption: Radio

| Symbol                 | Description                                                 | Min. | Typ. | Max. | Units |

## 18 POWER — Power supply

This device has the following power supply features:

- On-chip LDO and DC/DC regulators
- Global System ON/OFF modes
- Individual RAM section power control for all system modes
- Analog or digital pin wakeup from System OFF
- Supervisor HW to manage power on reset, brownout, and power fail
- Auto-controlled refresh modes for LDO and DC/DC regulators to maximize efficiency
- Automatic switching between LDO and DC/DC regulator based on load to maximize efficiency

**Note:** Two additional external passive components are required to use the DC/DC regulator.

### 18.1 Regulators

The following internal power regulator alternatives are supported:

- Internal LDO regulator
- Internal DC/DC regulator

The LDO is the default regulator.

The DC/DC regulator can be used as an alternative to the LDO regulator and is enabled through the [DCDCEN](#) on page 88 register. Using the DC/DC regulator will reduce current consumption compared to when using the LDO regulator, but the DC/DC regulator requires an external LC filter to be connected, as shown in [Figure 14: DC/DC regulator setup](#) on page 79.

**Figure 13: LDO regulator setup**

**Figure 14: DC/DC regulator setup**

## 18.2 System OFF mode

System OFF is the deepest power saving mode the system can enter. In this mode, the system's core functionality is powered down and all ongoing tasks are terminated.

The device can be put into System OFF mode using the POWER register interface. When in System OFF mode, the device can be woken up through one of the following signals:

1. The DETECT signal, optionally generated by the GPIO peripheral
2. The ANADETECT signal, optionally generated by the LPCOMP module
3. The SENSE signal, optionally generated by the NFC module to “wake-on-field”
4. A reset

When the system wakes up from System OFF mode, it gets reset. For more details, see [Reset behavior](#) on page 83.

One or more RAM sections can be retained in System OFF mode depending on the settings in the RAM[n].POWER registers.

RAM[n].POWER are retained registers, see [Reset behavior](#). Note that these registers are usually overwritten by the startup code provided with the nRF application examples.

Before entering System OFF mode, the user must make sure that all on-going EasyDMA transactions have been completed. This is usually accomplished by making sure that the EasyDMA enabled peripheral is not active when entering System OFF.

### 18.2.1 Emulated System OFF mode

If the device is in debug interface mode, System OFF will be emulated to secure that all required resources needed for debugging are available during System OFF.

See [Debug and trace](#) on page 72 for more information. Required resources needed for debugging include the following key components: [Debug and trace](#) on page 72, [CLOCK — Clock control](#) on page 101, [POWER — Power supply](#) on page 78, [NVMC — Non-volatile memory controller](#) on page 29, CPU, Flash, and RAM. Since the CPU is kept on in an emulated System OFF mode, it is recommended to add an infinite loop directly after entering System OFF, to prevent the CPU from executing code that normally should not be executed.

## 18.3 System ON mode

System ON is the default state after power-on reset. In System ON, all functional blocks such as the CPU or peripherals, can be in IDLE or RUN mode, depending on the configuration set by the software and the state of the application executing.

Register [RESETREAS](#) on page 85 provides information about the source that caused the wakeup or reset.

The system can switch on and off the appropriate internal power sources, depending on how much power is needed at any given time. The power requirement of a peripheral is directly related to its activity level, and the activity level of a peripheral is usually raised and lowered when specific tasks are triggered or events are generated.

### 18.3.1 Sub power modes

In System ON mode, when both the CPU and all the peripherals are in IDLE mode, the system can reside in one of the two sub power modes.

The sub power modes are:

- Constant latency
- Low power

In constant latency mode the CPU wakeup latency and the PPI task response will be constant and kept at a minimum. This is secured by forcing a set of base resources on while in sleep. The advantage of having a constant and predictable latency will be at the cost of having increased power consumption. The constant latency mode is selected by triggering the CONSTLAT task.

In low power mode the automatic power management system, described in [System ON mode](#) on page 80, ensures the most efficient supply option is chosen to save the most power. The advantage of having the lowest power possible will be at the cost of having varying CPU wakeup latency and PPI task response. The low power mode is selected by triggering the LOWPWR task.

When the system enters System ON mode, it will, by default, reside in the low power sub-power mode.

## 18.4 Power supply supervisor

The power supply supervisor initializes the system at power-on and provides an early warning of impending power failure.

In addition, the power supply supervisor puts the system in a reset state if the supply voltage is too low for safe operation (brownout). The power supply supervisor is illustrated in [Figure 15: Power supply supervisor](#) on page 81.

**Figure 15: Power supply supervisor**

### 18.4.1 Power-fail comparator

The power-fail comparator (POF) can provide the CPU with an early warning of impending power failure. It will not reset the system, but give the CPU time to prepare for an orderly power-down.

The comparator features a hysteresis of  $V_{HYST}$ , as illustrated in [Figure 16: Power-fail comparator \(BOR = Brownout reset\)](#) on page 81. The threshold  $V_{POF}$  is set in register [POFCON](#) on page 86. If the POF is enabled and the supply voltage falls below  $V_{POF}$ , the POWARN event will be generated. This event will also be generated if the supply voltage is already below  $V_{POF}$  at the time the POF is enabled, or if  $V_{POF}$  is re-configured to a level above the supply voltage.

If power-fail warning is enabled and the supply voltage is below  $V_{POF}$  the power-fail comparator will prevent the NVMC from performing write operations to the NVM. See [NVMC — Non-volatile memory controller](#) on page 29 for more information about the NVMC.

**Figure 16: Power-fail comparator (BOR = Brownout reset)**

To save power, the power-fail comparator is not active in System OFF or in System ON when HFCLK is not running.

## 18.5 RAM sections

RAM section power control is used for retention in System OFF mode and for powering down unused sections in System ON mode.

Each RAM section can power up and down independently in both System ON and System OFF mode. See chapter [Memory](#) on page 23 for more information on RAM sections.

## 18.6 Reset

There are multiple sources that may trigger a reset.

After a reset has occurred, register [RESETREAS](#) can be read to determine which source generated the reset.

### 18.6.1 Power-on reset

The power-on reset generator initializes the system at power-on.

The system is held in reset state until the supply has reached the minimum operating voltage and the internal voltage regulators have started.

A step increase in supply voltage of 300 mV or more, with rise time of 300 ms or less, within the valid supply range, may result in a system reset.

### 18.6.2 Pin reset

A pin reset is generated when the physical reset pin on the device is asserted.

Pin reset is configured via the [PSELRESET\[0\]](#) and [PSELRESET\[1\]](#) registers.

**Note:** Pin reset is not available on all pins.

### 18.6.3 Wakeup from System OFF mode reset

The device is reset when it wakes up from System OFF mode.

The DAP is not reset following a wake up from System OFF mode if the device is in debug interface mode. Refer to chapter [Debug and trace](#) on page 72 for more information.

### 18.6.4 Soft reset

A soft reset is generated when the SYSRESETREQ bit of the Application Interrupt and Reset Control Register (AIRCRR register) in the ARM® core is set.

Refer to [ARM documentation](#) for more details.

A soft reset can also be generated via the [RESET](#) on page 73 register in the CTRL-AP.

### 18.6.5 Watchdog reset

A Watchdog reset is generated when the watchdog times out.

Refer to chapter [WDT — Watchdog timer](#) on page 410 for more information.

### 18.6.6 Brown-out reset

The brown-out reset generator puts the system in reset state if the supply voltage drops below the brownout reset (BOR) threshold.

Refer to section [Power fail comparator](#) on page 99 for more information.

## 18.7 Retained registers

A retained register is a register that will retain its value in System OFF mode and through a reset, depending on reset source. See individual peripheral chapters for information of which registers are retained for the various peripherals.

## 18.8 Reset behavior

| Reset source                      | Reset target<br>CPU | Peripherals | GPIO | Debug <sup>a</sup> | SWJ-DP | RAM            | WDT | Retained registers | RESETREAS |
|-----------------------------------|---------------------|-------------|------|--------------------|--------|----------------|-----|--------------------|-----------|
| CPU lockup <sup>6</sup>           | x                   | x           | x    |                    |        |                |     |                    |           |
| Soft reset                        | x                   | x           | x    |                    |        |                |     |                    |           |
| Wakeup from System OFF mode reset | x                   | x           |      | x <sup>7</sup>     |        | x <sup>8</sup> |     |                    |           |
| Watchdog reset <sup>9</sup>       | x                   | x           | x    | x                  |        | x              | x   | x                  |           |
| Pin reset                         | x                   | x           | x    | x                  |        | x              | x   | x                  |           |
| Brownout reset                    | x                   | x           | x    | x                  | x      | x              | x   | x                  | x         |
| Power on reset                    | x                   | x           | x    | x                  | x      | x              | x   | x                  | x         |

**Note:** The RAM is never reset, but depending on reset source, RAM content may be corrupted.

## 18.9 Registers

Table 23: Instances

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40000000   | POWER      | POWER    | Power control |               |

Table 24: Register Overview

| Register         | Offset | Description                                     |            |
|------------------|--------|-------------------------------------------------|------------|
| TASKS_CONSTLAT   | 0x078  | Enable constant latency mode                    |            |

| RAMONB           | 0x554  | RAM on/off register (this register is retained) | Deprecated |
| DCDCEN           | 0x578  | DC/DC enable register                           |            |
| RAM[0].POWER     | 0x900  | RAM0 power control register                     |            |

<sup>a</sup> All debug components excluding SWJ-DP. See [Debug and trace](#) on page 72 chapter for more information about the different debug components in the system.

<sup>6</sup> Reset from CPU lockup is disabled if the device is in debug interface mode. CPU lockup is not possible in System OFF.

<sup>7</sup> The Debug components will not be reset if the device is in debug interface mode.

<sup>8</sup> RAM is not reset on wakeup from OFF mode, but depending on settings in the RAM register parts, or the whole RAM, may not be retained after the device has entered System OFF mode.

<sup>9</sup> Watchdog reset is not available in System OFF.

| Register                        | Offset | Description                       |

### 18.9.3 RESETREAS

Address offset: 0x400

Reset reason

Unless cleared, the RESETREAS register will be cumulative. A field is cleared by writing '1' to it. If none of the reset sources are flagged, this indicates that the chip was reset from the on-chip reset generator, which will indicate a power-on-reset or a brownout reset.

### 18.9.4 RAMSTATUS ( Deprecated )

Address offset: 0x428

RAM status register

Since this register is deprecated the following substitutions have been made: RAM block 0 is equivalent to a block comprising RAM0.S0 and RAM1.S0, RAM block 1 is equivalent to a block comprising RAM2.S0 and RAM3.S0, RAM block 2 is equivalent to a block comprising RAM4.S0 and RAM5.S0 and RAM block 3 is equivalent to a block comprising RAM6.S0 and RAM7.S0. A RAM block field will indicate ON as long as any of the RAM sections associated with a block are on.

### 18.9.9 RAMON ( Deprecated )

Address offset: 0x524

RAM on/off register (this register is retained)

Since this register is deprecated the following substitutions have been made: RAM block 0 is equivalent to a block comprising RAM0.S0 and RAM0.S1 and RAM block 1 is equivalent to a block comprising RAM1.S0 and RAM1.S1. For new designs it is recommended to use the POWER.RAM-0.POWER and its sibling registers instead.

|                  |  |  |  |  ### 18.9.10 RAMONB ( Deprecated )

Address offset: 0x554

RAM on/off register (this register is retained)

Since this register is deprecated the following substitutions have been made: RAM block 2 is equivalent to a block comprising RAM2.S0 and RAM2.S1 and RAM block 3 is equivalent to a block comprising RAM3.S0 and RAM3.S1. For new designs it is recommended to use the POWER.RAM-0.POWER and its sibling registers instead.

### 18.9.17 RAM[1].POWERCLR

Address offset: 0x918

RAM1 power control clear register

When read, this register will return the value of the POWER register.

### 18.9.29 RAM[5].POWERCLR

Address offset: 0x958

RAM5 power control clear register

When read, this register will return the value of the POWER register.

## 18.10 Electrical specification

### 18.10.1 Current consumption, sleep

| Symbol           | Description                                           | Min. | Typ. | Max. | Units |
|------------------|-------------------------------------------------------|------|------|------|-------|
| I <sub>OFF</sub> | System OFF current, no RAM retention                  |      | 0.3  |      | μA    |
| I <sub>ON</sub>  | System ON base current, no RAM retention              |      | 1.2  |      | μA    |
| I <sub>RAM</sub> | Additional RAM retention current per 4 KB RAM section |      | 20   |      | nA    |

### 18.10.2 Device startup times

| Symbol                    | Description                                                                                                                                                                                        | Min.                                 | Typ.   | Max. | Units |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|--------|------|-------|
| t <sub>POR</sub>          | Time in Power on Reset after VDD reaches 1.7 V for all supply voltages and temperatures. Dependent on supply rise time. <sup>10</sup>                                                              |                                      |        |      |       |
| t <sub>POR,10us</sub>     | VDD rise time 10us                                                                                                                                                                                 |                                      | 1      |      | ms    |
| t <sub>POR,10ms</sub>     | VDD rise time 10ms                                                                                                                                                                                 |                                      | 9      |      | ms    |
| t <sub>POR,60ms</sub>     | VDD rise time 60ms                                                                                                                                                                                 |                                      | 23     |      | ms    |
| t <sub>PINR</sub>         | If a GPIO pin is configured as reset, the maximum time taken to pull up the pin and release reset after power on reset. Dependent on the pin capacitive load (C) <sup>11</sup> : t=5RC, R = 13kOhm |                                      |        |      |       |
| t <sub>PINR,500nF</sub>   | C = 500nF                                                                                                                                                                                          |                                      |        | 32.5 | ms    |
| t <sub>PINR,10uF</sub>    | C = 10uF                                                                                                                                                                                           |                                      |        | 650  | ms    |
| t <sub>R2ON</sub>         | Time from reset to ON (CPU execute)                                                                                                                                                                |                                      |        |      |       |
| t <sub>R2ON,NOTCONF</sub> | If reset pin not configured                                                                                                                                                                        | t <sub>POR</sub>                     |        |      | ms    |
| t <sub>R2ON,CONF</sub>    | If reset pin configured                                                                                                                                                                            | t <sub>POR</sub> + t <sub>PINR</sub> |        |      | ms    |
| t <sub>OFF2ON</sub>       | Time from OFF to CPU execute                                                                                                                                                                       |                                      | 16.5   |      | μs    |
| t <sub>IDLE2CPU</sub>     | Time from IDLE to CPU execute                                                                                                                                                                      |                                      | 3.0    |      | μs    |
| t <sub>EVTSET,CL1</sub>   | Time from HW event to PPI event in Constant Latency System ON mode                                                                                                                                 |                                      | 0.0625 |      | μs    |
| t <sub>EVTSET,CL0</sub>   | Time from HW event to PPI event in Low Power System ON mode                                                                                                                                        |                                      | 0.0625 |      | μs    |

### 18.10.3 Power fail comparator

| Symbol              | Description                                                                                                                         | Min. | Typ. | Max. | Units |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>POF</sub>    | Current consumption when enabled <sup>12</sup>                                                                                      |      | <4   |      | μA    |
| V <sub>POF</sub>    | Nominal power level warning thresholds (falling supply voltage). Levels are configurable between Min. and Max. in 100mV increments. | 1.7  |      | 2.8  | V     |
| V <sub>POFTOL</sub> | Threshold voltage tolerance                                                                                                         |      | ±1   | ±5   | %     |

<sup>10</sup> A step increase in supply voltage of 300 mV or more, with rise time of 300 ms or less, within the valid supply range, may result in a system reset.

<sup>11</sup> To decrease maximum time a device could hold in reset, a strong external pullup resistor can be used.

<sup>12</sup> To save power, POF will not operate nor consume in System OFF, or while HFCLK is not running, even if left enabled by software

| Symbol        | Description                                   | Min. | Typ. | Max. | Units |
|---------------|-----------------------------------------------|------|------|------|-------|
| $V_{POFHYST}$ | Threshold voltage hysteresis                  |      | 50   |      | mV    |
| $V_{BOR,OFF}$ | Brown out reset voltage range SYSTEM OFF mode | 1.2  |      | 1.7  | V     |
| $V_{BOR,ON}$  | Brown out reset voltage range SYSTEM ON mode  | 1.5  |      | 1.7  | V     |

## 19 CLOCK — Clock control

The clock control system can source the system clocks from a range of internal or external high and low frequency oscillators and distribute them to modules based upon a module's individual requirements. Clock distribution is automated and grouped independently by module to limit current consumption in unused branches of the clock tree.

Listed here are the main features for CLOCK:

- 64 MHz on-chip oscillator
- 64 MHz crystal oscillator, using external 32 MHz crystal
- 32.768 kHz +/-250 ppm RC oscillator
- 32.768 kHz crystal oscillator, using external 32.768 kHz crystal
- 32.768 kHz oscillator synthesized from 64 MHz oscillator
- Firmware (FW) override control of oscillator activity for low latency start up
- Automatic oscillator and clock control, and distribution for ultra-low power

**Figure 17: Clock control**

### 19.1 HFCLK clock controller

The HFCLK clock controller provides the following clocks to the system.

- HCLK64M: 64 MHz CPU clock
- PCLK1M: 1 MHz peripheral clock
- PCLK16M: 16 MHz peripheral clock
- PCLK32M: 32 MHz peripheral clock

The HFCLK controller supports the following high frequency clock (HFCLK) sources:

- 64 MHz internal oscillator (HFINT)
- 64 MHz crystal oscillator (HFXO)

For illustration, see [Figure 17: Clock control](#) on page 101.

When the system requests one or more clocks from the HFCLK controller, the HFCLK controller will automatically provide them. If the system does not request any clocks provided by the HFCLK controller, the controller will enter a power saving mode.

These clocks are only available when the system is in ON mode. When the system enters ON mode, the internal oscillator (HFINT) clock source will automatically start to be able to provide the required HFCLK clock(s) for the system.

The HFINT will be used when HFCLK is requested and HFXO has not been started. The HFXO is started by triggering the HFCLKSTART task and stopped using the HFCLKSTOP task. A HFCLKSTARTED event will be generated when the HFXO has started and its frequency is stable.

The HFXO must be running to use the RADIO, NFC module or the calibration mechanism associated with the 32.768 kHz RC oscillator.

### 19.1.1 64 MHz crystal oscillator (HFXO)

The 64 MHz crystal oscillator (HFXO) is controlled by a 32 MHz external crystal

The crystal oscillator is designed for use with an AT-cut quartz crystal in parallel resonant mode. To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet.

*Figure 18: Circuit diagram of the 64 MHz crystal oscillator* on page 102 shows how the 32 MHz crystal is connected to the 64 MHz crystal oscillator.

**Figure 18: Circuit diagram of the 64 MHz crystal oscillator**

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is given by:

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground. For more information, see [Reference circuitry](#) on page 546.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitances on the PCB.  $C_{pin}$  is the pin input capacitance on the xc1 and xc2 pins. See table [64 MHz crystal oscillator \(HFXO\)](#) on page 109. The load capacitors C1 and C2 should have the same value.

For reliable operation, the crystal load capacitance, shunt capacitance, equivalent series resistance, and drive level must comply with the specifications in table [64 MHz crystal oscillator \(HFXO\)](#) on page 109. It is recommended to use a crystal with lower than maximum load capacitance and/or shunt capacitance. A low load capacitance will reduce both start up time and current consumption.

## 19.2 LFCLK clock controller

The system supports several low frequency clock sources.

As illustrated in [Figure 17: Clock control](#) on page 101, the system supports the following low frequency clock sources:

- 32.768 kHz RC oscillator (LFRC)
- 32.768 kHz crystal oscillator (LFXO)
- 32.768 kHz synthesized from HFCLK (LFSYNT)

The LFCLK clock is started by first selecting the preferred clock source in register [LFCLKSRC](#) on page 108 and then triggering the LFCLKSTART task. If the LFXO is selected as the clock source, the LFCLK will initially start running from the 32.768 kHz LFRC while the LFXO is starting up and automatically switch to using the LFXO once this oscillator is running. The LFCLKSTARTED event will be generated when the LFXO has been started.

The LFCLK clock is stopped by triggering the LFCLKSTOP task.

It is not allowed to write to register [LFCLKSRC](#) on page 108 when the LFCLK is running.

A LFCLKSTOP task will stop the LFCLK oscillator. However, the LFCLKSTOP task can only be triggered after the STATE field in register [LFCLKSTAT](#) on page 107 indicates a 'LFCLK running' state.

The LFCLK clock controller and all of the LFCLK clock sources are always switched off when in OFF mode.

### 19.2.1 32.768 kHz RC oscillator (LFRC)

The default source of the low frequency clock (LFCLK) is the 32.768 kHz RC oscillator (LFRC).

The LFRC frequency will be affected by variation in temperature. The LFRC oscillator can be calibrated to improve accuracy by using the HFXO as a reference oscillator during calibration. See [Table 32.768 kHz RC oscillator \(LFRC\)](#) on page 109 for details on the default and calibrated accuracy of the LFRC oscillator.

The LFRC oscillator does not require additional external components.

### 19.2.2 Calibrating the 32.768 kHz RC oscillator

After the 32.768 kHz RC oscillator is started and running, it can be calibrated by triggering the CAL task. In this case, the HFCLK will be temporarily switched on and used as a reference.

A DONE event will be generated when calibration has finished. The calibration mechanism will only work as long as HFCLK is generated from the HFCLK crystal oscillator, it is therefore necessary to explicitly start this crystal oscillator before calibration can be started, see HFCLKSTART task.

### 19.2.3 Calibration timer

The calibration timer can be used to time the calibration interval of the 32.768 kHz RC oscillator.

The calibration timer is started by triggering the CTSTART task and stopped by triggering the CTSTOP task. The calibration timer will always start counting down from the value specified in CTIV and generate a CTTO timeout event when it reaches 0. The Calibration timer will stop by itself when it reaches 0.

**Figure 19: Calibration timer**

Due to limitations in the calibration timer, only one task related to calibration, that is, CAL, CTSTART and CTSTOP, can be triggered for every period of LFCLK.

### 19.2.4 32.768 kHz crystal oscillator (LFXO)

For higher LFCLK accuracy (when better than +/- 250 ppm accuracy is required), the low frequency crystal oscillator (LFXO) must be used.

The following external clock sources are supported:

- Low swing clock signal applied to the *XL1* pin. The *XL2* pin shall then be grounded.
- Rail-to-rail clock signal applied to the *XL1* pin. The *XL2* pin shall then be grounded or left unconnected.

The [LFCLKSRC](#) on page 108 register controls the clock source, and its allowed swing. The truth table for various situations is as follows:

**Table 25: LFCLKSRC configuration depending on clock source**

| SRC | EXTERNAL | BYPASS | Comment                                                                    |
|-----|----------|--------|----------------------------------------------------------------------------|
| 0   | 0        | 0      | Normal operation, RC is source                                             |
| 0   | 0        | 1      | DO NOT USE                                                                 |
| 0   | 1        | X      | DO NOT USE                                                                 |
| 1   | 0        | 0      | Normal XTAL operation                                                      |
| 1   | 1        | 0      | Apply external low swing signal to XL1, ground XL2                         |
| 1   | 1        | 1      | Apply external full swing signal to XL1, leave XL2 grounded or unconnected |
| 1   | 0        | 1      | DO NOT USE                                                                 |
| 2   | 0        | 0      | Normal operation, synth is source                                          |
| 2   | 0        | 1      | DO NOT USE                                                                 |
| 2   | 1        | X      | DO NOT USE                                                                 |

To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet. [Figure 20: Circuit diagram of the 32.768 kHz crystal oscillator](#) on page 104 shows the LFXO circuitry.

**Figure 20: Circuit diagram of the 32.768 kHz crystal oscillator**

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is given by:

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitances on the PCB.  $C_{pin}$  is the pin input capacitance on the XC1 and XC2 pins (see [32.768 kHz crystal oscillator \(LFXO\)](#) on page 109). The load capacitors C1 and C2 should have the same value.

For more information, see [Reference circuitry](#) on page 546.

### 19.2.5 32.768 kHz synthesized from HFCLK (LFSYNT)

LFCLK can also be synthesized from the HFCLK clock source. The accuracy of LFCLK will then be the accuracy of the HFCLK.

Using the LFSYNT clock avoids the requirement for a 32.768 kHz crystal, but increases average power consumption as the HFCLK will need to be requested in the system.

## 19.3 Registers

**Table 26: Instances**

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40000000   | CLOCK      | CLOCK    | Clock control |               |

**Table 27: Register Overview**

| Register            | Offset | Description                                                       |
|---------------------|--------|-------------------------------------------------------------------|
| TASKS_HFCLKSTART    | 0x000  | Start HFCLK crystal oscillator                                    |
| TASKS_HFCLKSTOP     | 0x004  | Stop HFCLK crystal oscillator                                     |
| TASKS_LFCLKSTART    | 0x008  | Start LFCLK source                                                |

### 19.4.2 64 MHz crystal oscillator (HFXO)

| Symbol                      | Description                                                                | Min. | Typ. | Max. | Units |
|-----------------------------|----------------------------------------------------------------------------|------|------|------|-------|
| $f_{\text{NOM\_HFXO}}$      | Nominal output frequency                                                   |      | 64   |      | MHz   |
| $f_{\text{XTAL\_HFXO}}$     | External crystal frequency                                                 |      | 32   |      | MHz   |
| $f_{\text{TOL\_HFXO}}$      | Frequency tolerance requirement for 2.4 GHz proprietary radio applications |      |      | ±60  | ppm   |
| $f_{\text{TOL\_HFXO\_BLE}}$ | Frequency tolerance requirement, Bluetooth low energy applications         |      |      | ±40  | ppm   |
| $C_{\text{L\_HFXO}}$        | Load capacitance                                                           |      |      | 12   | pF    |
| $C_{\text{O\_HFXO}}$        | Shunt capacitance                                                          |      |      | 7    | pF    |
| $R_{\text{S\_HFXO\_7PF}}$   | Equivalent series resistance $C_0 = 7$ pF                                  |      |      | 60   | ohm   |
| $R_{\text{S\_HFXO\_5PF}}$   | Equivalent series resistance $C_0 = 5$ pF                                  |      |      | 80   | ohm   |
| $R_{\text{S\_HFXO\_3PF}}$   | Equivalent series resistance $C_0 = 3$ pF                                  |      |      | 100  | ohm   |
| $P_{\text{D\_HFXO}}$        | Drive level                                                                |      |      | 100  | uW    |
| $C_{\text{PIN\_HFXO}}$      | Input capacitance XC1 and XC2                                              |      | 4    |      | pF    |
| $I_{\text{STBY\_X32M}}$     | Core standby current <sup>13</sup>                                         |      | 50   |      | μA    |
| $I_{\text{HFXO}}$           | Run current                                                                |      | 250  |      | μA    |
| $I_{\text{START\_HFXO}}$    | Average startup current, first 1 ms                                        |      | 0.4  |      | mA    |
| $t_{\text{START\_HFXO}}$    | Startup time                                                               |      | 0.36 |      | ms    |

### 19.4.3 32.768 kHz RC oscillator (LFRC)

| Symbol                      | Description                                                  | Min. | Typ.   | Max. | Units |
|-----------------------------|--------------------------------------------------------------|------|--------|------|-------|
| $f_{\text{NOM\_LFRC}}$      | Nominal frequency                                            |      | 32.768 |      | kHz   |
| $f_{\text{TOL\_LFRC}}$      | Frequency tolerance                                          |      |        | ±2   | %     |
| $f_{\text{TOL\_CAL\_LFRC}}$ | Frequency tolerance for LFRC after calibration <sup>14</sup> |      |        | ±250 | ppm   |
| $I_{\text{LFRC}}$           | Run current for 32.768 kHz RC oscillator                     |      | 0.6    | 1    | μA    |
| $t_{\text{START\_LFRC}}$    | Startup time for 32.768 kHz RC oscillator                    |      | 600    |      | us    |

### 19.4.4 32.768 kHz crystal oscillator (LFXO)

| Symbol                      | Description                                   | Min. | Typ.   | Max. | Units |
|-----------------------------|-----------------------------------------------|------|--------|------|-------|
| $f_{\text{NOM\_LFXO}}$      | Crystal frequency                             |      | 32.768 |      | kHz   |
| $f_{\text{TOL\_LFXO\_BLE}}$ | Frequency tolerance requirement for BLE stack |      |        | ±250 | ppm   |
| $f_{\text{TOL\_LFXO\_ANT}}$ | Frequency tolerance requirement for ANT stack |      |        | ±50  | ppm   |
| $C_{\text{L\_LFXO}}$        | Load capacitance                              |      |        | 12.5 | pF    |
| $C_{\text{O\_LFXO}}$        | Shunt capacitance                             |      |        | 2    | pF    |
| $R_{\text{S\_LFXO}}$        | Equivalent series resistance                  |      |        | 100  | kohm  |
| $P_{\text{D\_LFXO}}$        | Drive level                                   |      |        | 1    | uW    |
| $C_{\text{pin}}$            | Input capacitance on XL1 and XL2 pads         |      | 4      |      | pF    |
| $I_{\text{LFXO}}$           | Run current for 32.768 kHz crystal oscillator |      | 0.25   |      | μA    |

<sup>13</sup> Current drawn if HFXO is forced on through for instance using the low latency power mode.

<sup>14</sup> Constant temperature within ±0.5 °C and calibration performed at least every 8 seconds

| Symbol                        | Description                                                                                            | Min. | Typ. | Max. | Units |
|-------------------------------|--------------------------------------------------------------------------------------------------------|------|------|------|-------|
| $t_{\text{START\_LFXO}}$      | Startup time for 32.768 kHz crystal oscillator                                                         |      | 0.25 |      | s     |
| $V_{\text{AMP\_IN\_XO\_LOW}}$ | Peak to peak amplitude for external low swing clock. Input signal must not swing outside supply rails. | 200  |      | 1000 | mV    |

### 19.4.5 32.768 kHz synthesized from HFCLK (LFSYNT)

| Symbol                     | Description                                                      | Min. | Typ.   | Max. | Units |
|----------------------------|------------------------------------------------------------------|------|--------|------|-------|
| $f_{\text{NOM\_LFSYNT}}$   | Nominal frequency                                                |      | 32.768 |      | kHz   |
| $f_{\text{TOL\_LFSYNT}}$   | Frequency tolerance in addition to HFCLK tolerance <sup>15</sup> |      | 8      |      | ppm   |
| $I_{\text{LFSYNT}}$        | Run current for synthesized 32.768 kHz                           |      | 100    |      | μA    |
| $t_{\text{START\_LFSYNT}}$ | Startup time for synthesized 32.768 kHz                          |      | 100    |      | us    |

<sup>15</sup> Frequency tolerance will be derived from the HFCLK source clock plus the LFSYNT tolerance

## 20 GPIO — General purpose input/output

The general purpose input/output (GPIO) is organized as one port with up to 32 I/Os (dependent on package) enabling access and control of up to 32 pins through one port. Each GPIO can be accessed individually.

GPIO has the following user-configurable features:

- Up to 32 GPIO
- 8 GPIO with Analog channels for SAADC, COMP or LPCOMP inputs
- Configurable output drive strength
- Internal pull-up and pull-down resistors
- Wake-up from high or low level triggers on all pins
- Trigger interrupt on state changes on any pin
- All pins can be used by the PPI task/event system
- One or more GPIO outputs can be controlled through PPI and GPIOTE channels
- All pins can be individually mapped to interface blocks for layout flexibility
- GPIO state changes captured on SENSE signal can be stored by LATCH register

The GPIO Port peripheral implements up to 32 pins, `PIN0` through `PIN31`. Each of these pins can be individually configured in the `PIN_CNF[n]` registers ( $n=0..31$ ).

The following parameters can be configured through these registers:

- Direction
- Drive strength
- Enabling of pull-up and pull-down resistors
- Pin sensing
- Input buffer disconnect
- Analog input (for selected pins)

The `PIN_CNF` registers are retained registers. See [POWER — Power supply](#) on page 78 chapter for more information about retained registers.

### 20.1 Pin configuration

Pins can be individually configured, through the `SENSE` field in the `PIN_CNF[n]` register, to detect either a high level or a low level on their input.

When the correct level is detected on any such configured pin, the sense mechanism will set the `DETECT` signal high. Each pin has a separate `DETECT` signal, and the default behaviour, as defined by the `DETECTMODE` register, is that the `DETECT` signal from all pins in the GPIO Port are combined into a common `DETECT` signal that is routed throughout the system, which then can be utilized by other peripherals, see [Figure 21: GPIO Port and the GPIO pin details](#) on page 112. This mechanism is functional in both ON and OFF mode.

**Figure 21: GPIO Port and the GPIO pin details**

*Figure 21: GPIO Port and the GPIO pin details* on page 112 illustrates the GPIO port containing 32 individual pins, where PIN0 is illustrated in more detail as a reference. All the signals on the left side of the illustration are used by other peripherals in the system, and therefore, are not directly available to the CPU.

Make sure that a pin is in a level that cannot trigger the sense mechanism before enabling it. Detect will go high immediately if the sense condition configured in the PIN\_CNF registers is met when the sense mechanism is enabled. This will trigger a PORT event if the DETECT signal was low before enabling the sense mechanism. See [GPiOTE — GPIO tasks and events](#) on page 157.

See the following peripherals for more information about how the DETECT signal is used:

- **POWER:** uses the DETECT signal to exit from System OFF.
- **GPIOTE:** uses the DETECT signal to generate the PORT event.

When a pin's PINx.DETECT signal goes high, a flag will be set in the LATCH register, e.g. when the PIN0.DETECT signal goes high, bit 0 in the LATCH register will be set to '1'.

The LATCH register will only be cleared if the CPU explicitly clears it by writing a '1' to the bit that shall be cleared, i.e. the LATCH register will not be affected by a PINx.DETECT signal being set low.

If the CPU performs a clear operation on a bit in the LATCH register when the associated PINx.DETECT signal is high, the bit in the LATCH register will not be cleared.

The LDETECT signal will be set high when one or more bits in the LATCH register are '1'. The LDETECT signal will be set low when all bits in the LATCH register are successfully cleared to '0'.

If one or more bits in the LATCH register are '1' after the CPU has performed a clear operation on the LATCH registers, a rising edge will be generated on the LDETECT signal, this is illustrated in [Figure 22: DETECT signal behavior](#) on page 113.

**Important:** The CPU can read the LATCH register at any time to check if a SENSE condition has been met on one or more of the the GPIO pins even if that condition is no longer met at the time the CPU queries the LATCH register. This mechanism will work even if the LDETECT signal is not used as the DETECT signal.

The LDETECT signal is by default not connected to the GPIO port's DETECT signal, but via the DETECTMODE register it is possible to change the behaviour of the GPIO port's DETECT signal from the default behaviour described above to instead be derived directly from the LDETECT signal, see [Figure 21: GPIO Port and the GPIO pin details](#) on page 112. [Figure 22: DETECT signal behavior](#) on page 113 illustrates the DETECT signals behaviour for these two alternatives.

**Figure 22: DETECT signal behavior**

The input buffer of a GPIO pin can be disconnected from the pin to enable power savings when the pin is not used as an input, see [Figure 21: GPIO Port and the GPIO pin details](#) on page 112. Inputs must be connected in order to get a valid input value in the IN register and for the sense mechanism to get access to the pin.

Other peripherals in the system can attach themselves to GPIO pins and override their output value and configuration, or read their analog or digital input value, see [Figure 21: GPIO Port and the GPIO pin details](#) on page 112.

Selected pins also support analog input signals, see ANAIN in [Figure 21: GPIO Port and the GPIO pin details](#) on page 112. The assignment of the analog pins can be found in [Pin assignments](#) on page 13.

**Important:** When a pin is configured as digital input, care has been taken in the nRF52832 design to minimize increased current consumption when the input voltage is between  $V_{IL}$  and  $V_{IH}$ . However, it is a good practice to ensure that the external circuitry does not drive that pin to levels between  $V_{IL}$  and  $V_{IH}$  for a long period of time.

## 20.2 GPIO located near the RADIO

Radio performance parameters, such as sensitivity, may be affected by high frequency digital I/O with large sink/source current close to the radio power supply and antenna pins.

Refer to [Pin assignments](#) on page 13 for recommended usage guidelines to maximize radio performance in an application.

## 20.3 Registers

**Table 28: Instances**

| Base address | Peripheral | Instance | Description                      | Configuration |
|--------------|------------|----------|----------------------------------|---------------|
| 0x50000000   | GPIO       | GPIO     | General purpose input and output | Deprecated    |
| 0x50000000   | GPIO       | P0       | General purpose input and output |               |

**Table 29: Register Overview**

| Register           | Offset | Description                                                                                               |
|--------------------|--------|-----------------------------------------------------------------------------------------------------------|
| <i>OUT</i>         | 0x504  | Write GPIO port                                                                                           |
| <i>OUTSET</i>      | 0x508  | Set individual bits in GPIO port                                                                          |
| <i>OUTCLR</i>      | 0x50C  | Clear individual bits in GPIO port                                                                        |
| <i>IN</i>          | 0x510  | Read GPIO port                                                                                            |
| <i>DIR</i>         | 0x514  | Direction of GPIO pins                                                                                    |
| <i>DIRSET</i>      | 0x518  | DIR set register                                                                                          |
| <i>DIRCLR</i>      | 0x51C  | DIR clear register                                                                                        |
| <i>LATCH</i>       | 0x520  | Latch register indicating what GPIO pins that have met the criteria set in the PIN_CNF[n].SENSE registers |
| <i>DETECTMODE</i>  | 0x524  | Select between default DETECT signal behaviour and LDETECT mode                                           |
| <i>PIN_CNF[0]</i>  | 0x700  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[1]</i>  | 0x704  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[2]</i>  | 0x708  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[3]</i>  | 0x70C  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[4]</i>  | 0x710  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[5]</i>  | 0x714  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[6]</i>  | 0x718  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[7]</i>  | 0x71C  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[8]</i>  | 0x720  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[9]</i>  | 0x724  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[10]</i> | 0x728  | Configuration of GPIO pins                                                                                |
| <i>PIN_CNF[11]</i> | 0x72C  | Configuration of GPIO pins                                                                                |

   ## 20.4 Electrical specification

### 20.4.1 GPIO Electrical Specification

| Symbol          | Description        | Min.      | Typ. | Max. | Units |
|-----------------|--------------------|-----------|------|------|-------|
| V <sub>IH</sub> | Input high voltage | 0.7 x VDD |      | VDD  | V     |

| Symbol          | Description                                                                   | Min.         | Typ. | Max.                | Units |
|-----------------|-------------------------------------------------------------------------------|--------------|------|---------------------|-------|
| $V_{IL}$        | Input low voltage                                                             | VSS          |      | $0.3 \times V_{DD}$ | V     |
| $V_{OH,SD}$     | Output high voltage, standard drive, 0.5 mA, $V_{DD} \geq 1.7$                | $V_{DD}-0.4$ |      | VDD                 | V     |
| $V_{OH,HDL}$    | Output high voltage, high drive, 5 mA, $V_{DD} \geq 2.7$ V                    | $V_{DD}-0.4$ |      | VDD                 | V     |
| $V_{OH,HDL}$    | Output high voltage, high drive, 3 mA, $V_{DD} \geq 1.7$ V                    | $V_{DD}-0.4$ |      | VDD                 | V     |
| $V_{OL,SD}$     | Output low voltage, standard drive, 0.5 mA, $V_{DD} \geq 1.7$                 | VSS          |      | $V_{SS}+0.4$        | V     |
| $V_{OL,HDL}$    | Output low voltage, high drive, 5 mA, $V_{DD} \geq 2.7$ V                     | VSS          |      | $V_{SS}+0.4$        | V     |
| $V_{OL,HDL}$    | Output low voltage, high drive, 3 mA, $V_{DD} \geq 1.7$ V                     | VSS          |      | $V_{SS}+0.4$        | V     |
| $I_{OL,SD}$     | Current at $V_{SS}+0.4$ V, output set low, standard drive, $V_{DD} \geq 1.7$  | 1            | 2    | 4                   | mA    |
| $I_{OL,HDL}$    | Current at $V_{SS}+0.4$ V, output set low, high drive, $V_{DD} \geq 2.7$ V    | 6            | 10   | 15                  | mA    |
| $I_{OL,HDL}$    | Current at $V_{SS}+0.4$ V, output set low, high drive, $V_{DD} \geq 1.7$ V    | 3            |      |                     | mA    |
| $I_{OH,SD}$     | Current at $V_{DD}-0.4$ V, output set high, standard drive, $V_{DD} \geq 1.7$ | 1            | 2    | 4                   | mA    |
| $I_{OH,HDL}$    | Current at $V_{DD}-0.4$ V, output set high, high drive, $V_{DD} \geq 2.7$ V   | 6            | 9    | 14                  | mA    |
| $I_{OH,HDL}$    | Current at $V_{DD}-0.4$ V, output set high, high drive, $V_{DD} \geq 1.7$ V   | 3            |      |                     | mA    |
| $t_{RF,15pF}$   | Rise/fall time, low drive mode, 10-90%, 15 pF load <sup>1</sup>               |              | 9    |                     | ns    |
| $t_{RF,25pF}$   | Rise/fall time, low drive mode, 10-90%, 25 pF load <sup>1</sup>               |              | 13   |                     | ns    |
| $t_{RF,50pF}$   | Rise/fall time, low drive mode, 10-90%, 50 pF load <sup>1</sup>               |              | 25   |                     | ns    |
| $t_{HRF,15pF}$  | Rise/Fall time, high drive mode, 10-90%, 15 pF load <sup>1</sup>              |              | 4    |                     | ns    |
| $t_{HRF,25pF}$  | Rise/Fall time, high drive mode, 10-90%, 25 pF load <sup>1</sup>              |              | 5    |                     | ns    |
| $t_{HRF,50pF}$  | Rise/Fall time, high drive mode, 10-90%, 50 pF load <sup>1</sup>              |              | 8    |                     | ns    |
| $R_{PU}$        | Pull-up resistance                                                            | 11           | 13   | 16                  | kΩ    |
| $R_{PD}$        | Pull-down resistance                                                          | 11           | 13   | 16                  | kΩ    |
| $C_{PAD}$       | Pad capacitance                                                               |              | 3    |                     | pF    |
| $C_{PAD\_NFC}$  | Pad capacitance on NFC pads                                                   |              | 4    |                     | pF    |
| $I_{NFC\_LEAK}$ | Leakage current between NFC pads when driven to different states              |              | 2    | 10                  | μA    |

The current drawn from the battery when GPIO is active as an output is calculated as follows:

$$I_{GPIO} = V_{DD} C_{load} f$$

$C_{load}$  being the load capacitance and “f” is the switching frequency.

## 21 GPIOTE — GPIO tasks and events

The GPIO tasks and events (GPIOTE) module provides functionality for accessing GPIO pins using tasks and events. Each GPIOTE channel can be assigned to one pin.

A GPIOTE block enables GPIOs to generate events on pin state change which can be used to carry out tasks through the PPI system. A GPIO can also be driven to change state on system events using the PPI system. Low power detection of pin state changes is possible when in System ON or System OFF.

**Table 30: GPIOTE properties**

| Instance | Number of GPIOTE channels |
|----------|---------------------------|
| GPIOTE   | 8                         |

Up to three tasks can be used in each GPIOTE channel for performing write operations to a pin. Two tasks are fixed (SET and CLR), and one (OUT) is configurable to perform following operations:

- Set
- Clear
- Toggle

An event can be generated in each GPIOTE channel from one of the following input conditions:

- Rising edge
- Falling edge
- Any change

### 21.1 Pin events and tasks

The GPIOTE module has a number of tasks and events that can be configured to operate on individual GPIO pins.

The tasks (SET[n], CLR[n] and OUT[n]) can be used for writing to individual pins, and the events (IN[n]) can be generated from changes occurring at the inputs of individual pins.

The SET task will set the pin selected in CONFIG[n].PSEL to high.

The CLR task will set the pin low.

The effect of the OUT task on the pin is configurable in CONFIG[n].POLARITY , and can either set the pin high, set it low, or toggle it.

The tasks and events are configured using the CONFIG[n] registers. Every set of SET, CLR and OUT[n] tasks and IN[n] events has one CONFIG[n] register associated with it.

As long as a SET[n], CLR[n] and OUT[n] task or an IN[n] event is configured to control a pin *n*, the pin's output value will only be updated by the GPIOTE module. The pin's output value as specified in the GPIO will therefore be ignored as long as the pin is controlled by GPIOTE. Attempting to write a pin as a normal GPIO pin will have no effect. When the GPIOTE is disconnected from a pin, see MODE field in CONFIG[n] register, the associated pin will get the output and configuration values specified in the GPIO module.

When conflicting tasks are triggered simultaneously (i.e. during the same clock cycle) in one channel, the precedence of the tasks will be as described in [Table 31: Task priorities](#) on page 157.

**Table 31: Task priorities**

| Priority | Task |
|----------|------|
| 1        | OUT  |
| 2        | CLR  |
| 3        | SET  |

When setting the CONFIG[n] registers, MODE=Disabled does not have the same effect as MODE=Task and POLARITY=None. In the latter case, a CLR or SET task occurring at the exact same time as OUT will end up with no change on the pin, according to the priorities described in the table above.

When a GPIOTE channel is configured to operate on a pin as a task, the initial value of that pin is configured in the OUTINIT field of CONFIG[n].

## 21.2 Port event

PORT is an event that can be generated from multiple input pins using the GPIO DETECT signal.

The event will be generated on the rising edge of the DETECT signal. See [GPIO — General purpose input/output](#) on page 111 for more information about the DETECT signal.

Putting the system into System ON IDLE while DETECT is high will not cause DETECT to wake the system up again. Make sure to clear all DETECT sources before entering sleep. If the LATCH register is used as a source, if any bit in LATCH is still high after clearing all or part of the register (for instance due to one of the PINx.DETECT signal still high), a new rising edge will be generated on DETECT, see [Pin configuration](#) on page 111.

Trying to put the system to System OFF while DETECT is high will cause a wakeup from System OFF reset.

This feature is always enabled although the peripheral itself appears to be IDLE, that is, no clocks or other power intensive infrastructure have to be requested to keep this feature enabled. This feature can therefore be used to wake up the CPU from a WFI or WFE type sleep in System ON with all peripherals and the CPU idle, that is, lowest power consumption in System ON mode.

In order to prevent spurious interrupts from the PORT event while configuring the sources, the user shall first disable interrupts on the PORT event (through INTENCLR.PORT), then configure the sources (PIN\_CNF[n].SENSE), clear any potential event that could have occurred during configuration (write '1' to EVENTS\_PORT), and finally enable interrupts (through INTENSET.PORT).

## 21.3 Tasks and events pin configuration

Each GPIOTE channel is associated with one physical GPIO pin through the CONFIG.PSEL field.

When Event mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an input, overriding the DIR setting in GPIO. Similarly, when Task mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an output overriding the DIR setting and OUT value in GPIO. When Disabled is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will use its configuration from the PIN[n].CNF registers in GPIO.

Only one GPIOTE channel can be assigned to one physical pin. Failing to do so may result in unpredictable behavior.

## 21.4 Registers

**Table 32: Instances**

| Base address | Peripheral | Instance | Description           | Configuration |
|--------------|------------|----------|-----------------------|---------------|
| 0x40006000   | GPIOTE     | GPIOTE   | GPIO Tasks and Events |               |

**Table 33: Register Overview**

| Register     | Offset | Description                                                                                             |
|--------------|--------|---------------------------------------------------------------------------------------------------------|
| TASKS_OUT[0] | 0x000  | Task for writing to pin specified in CONFIG[0].PSEL. Action on pin is configured in CONFIG[0].POLARITY. |
| TASKS_OUT[1] | 0x004  | Task for writing to pin specified in CONFIG[1].PSEL. Action on pin is configured in CONFIG[1].POLARITY. |

| Register     | Offset | Description                                                                                             |
|--------------|--------|---------------------------------------------------------------------------------------------------------|
| TASKS_OUT[2] | 0x008  | Task for writing to pin specified in CONFIG[2].PSEL. Action on pin is configured in CONFIG[2].POLARITY. |

## 21.5 Electrical specification

### 21.5.1 GPIOTE Electrical Specification

| Symbol                 | Description                                                     | Min. | Typ. | Max. | Units |
|------------------------|-----------------------------------------------------------------|------|------|------|-------|
| I <sub>GPIOTE,IN</sub> | Run current with 1 or more GPIOTE active channels in Input mode |      | 0.1  | 0.5  | μA    |

## 22 PPI — Programmable peripheral interconnect

The Programmable peripheral interconnect (PPI) enables peripherals to interact autonomously with each other using tasks and events independent of the CPU. The PPI allows precise synchronization between peripherals when real-time application constraints exist and eliminates the need for CPU activity to implement behavior which can be predefined using PPI.

**Figure 28: PPI block diagram**

The PPI system has, in addition to the fully programmable peripheral interconnections, a set of channels where the event end point (EEP) and task end points (TEP) are fixed in hardware. These fixed channels can be individually enabled, disabled, or added to PPI channel groups in the same way as ordinary PPI channels.

**Table 34: Configurable and fixed PPI channels**

| Instance    | Channel | Number of channels | Number of groups |
|-------------|---------|--------------------|------------------|
| PPI         | 0-19    | 20                 | 6                |
| PPI (fixed) | 20-31   | 12                 |                  |

The PPI provides a mechanism to automatically trigger a task in one peripheral as a result of an event occurring in another peripheral. A task is connected to an event through a PPI channel. The PPI channel is composed of three end point registers, one EEP and two TEPs. A peripheral task is connected to a TEP using the address of the task register associated with the task. Similarly, a peripheral event is connected to an EEP using the address of the event register associated with the event.

On each PPI channel, the signals are synchronized to the 16 MHz clock, to avoid any internal violation of setup and hold timings. As a consequence, events that are synchronous to the 16 MHz clock will be delayed by one clock period, while other asynchronous events will be delayed by up to one 16 MHz clock period.

Note that shortcuts (as defined in the SHORTS register in each peripheral) are not affected by this 16 MHz synchronization, and are therefore not delayed.

Each TEP implements a fork mechanism that enables a second task to be triggered at the same time as the task specified in the TEP is triggered. This second task is configured in the task end point register in the FORK registers groups, e.g. FORK.TEP[0] is associated with PPI channel CH[0].

There are two ways of enabling and disabling PPI channels:

- Enable or disable PPI channels individually using the CHEN, CHENSET, and CHENCLR registers.
- Enable or disable PPI channels in PPI channel groups through the groups' ENABLE and DISABLE tasks. Prior to these tasks being triggered, the PPI channel group must be configured to define which PPI channels belongs to which groups.

Note that when a channel belongs to two groups m and n, and CHG[m].EN and CHG[n].DIS occur simultaneously (m and n can be equal or different), EN on that channel has priority.

PPI tasks (for example, CHG[0].EN) can be triggered through the PPI like any other task, which means they can be hooked up to a PPI channel as a TEP. One event can trigger multiple tasks by using multiple channels and one task can be triggered by multiple events in the same way.

## 22.1 Pre-programmed channels

Some of the PPI channels are pre-programmed. These channels cannot be configured by the CPU, but can be added to groups and enabled and disabled like the general purpose PPI channels. The FORK TEP for these channels are still programmable and can be used by the application.

For a list of pre-programmed PPI channels, see the table below.

**Table 35: Pre-programmed channels**

| Channel | EEP                       | TEP                      |
|---------|---------------------------|--------------------------|
| 20      | TIMERO->EVENTS_COMPARE[0] | RADIO->TASKS_TXEN        |
| 21      | TIMERO->EVENTS_COMPARE[0] | RADIO->TASKS_RXEN        |
| 22      | TIMERO->EVENTS_COMPARE[1] | RADIO->TASKS_DISABLE     |
| 23      | RADIO->EVENTS_BCMATCH     | AAR->TASKS_START         |
| 24      | RADIO->EVENTS_READY       | CCM->TASKS_KSGEN         |
| 25      | RADIO->EVENTS_ADDRESS     | CCM->TASKS_CRYPT         |
| 26      | RADIO->EVENTS_ADDRESS     | TIMERO->TASKS_CAPTURE[1] |
| 27      | RADIO->EVENTS_END         | TIMERO->TASKS_CAPTURE[2] |
| 28      | RTCO->EVENTS_COMPARE[0]   | RADIO->TASKS_TXEN        |
| 29      | RTCO->EVENTS_COMPARE[0]   | RADIO->TASKS_RXEN        |
| 30      | RTCO->EVENTS_COMPARE[0]   | TIMERO->TASKS_CLEAR      |
| 31      | RTCO->EVENTS_COMPARE[0]   | TIMERO->TASKS_START      |

## 22.2 Registers

**Table 36: Instances**

| Base address | Peripheral | Instance | Description                          | Configuration |
|--------------|------------|----------|--------------------------------------|---------------|
| 0x4001F000   | PPI        | PPI      | Programmable Peripheral Interconnect |               |

**Table 37: Register Overview**

| Register         | Offset | Description             |
|------------------|--------|-------------------------|
| TASKS_CHG[0].EN  | 0x000  | Enable channel group 0  |
| TASKS_CHG[0].DIS | 0x004  | Disable channel group 0 |
| TASKS_CHG[1].EN  | 0x008  | Enable channel group 1  |
| TASKS_CHG[1].DIS | 0x00C  | Disable channel group 1 |
| TASKS_CHG[2].EN  | 0x010  | Enable channel group 2  |
| TASKS_CHG[2].DIS | 0x014  | Disable channel group 2 |
| TASKS_CHG[3].EN  | 0x018  | Enable channel group 3  |
| TASKS_CHG[3].DIS | 0x01C  | Disable channel group 3 |
| TASKS_CHG[4].EN  | 0x020  | Enable channel group 4  |

| Register         | Offset | Description                   |
|------------------|--------|-------------------------------|
| TASKS_CHG[4].DIS | 0x024  | Disable channel group 4       |
| TASKS_CHG[5].EN  | 0x028  | Enable channel group 5        |
| TASKS_CHG[5].DIS | 0x02C  | Disable channel group 5       |
| CHEN             | 0x500  | Channel enable register       |
| CHENSET          | 0x504  | Channel enable set register   |
| CHENCLR          | 0x508  | Channel enable clear register |
| CH[0].EEP        | 0x510  | Channel 0 event end-point     |
| CH[0].TEP        | 0x514  | Channel 0 task end-point      |
| CH[1].EEP        | 0x518  | Channel 1 event end-point     |
| CH[1].TEP        | 0x51C  | Channel 1 task end-point      |
| CH[2].EEP        | 0x520  | Channel 2 event end-point     |
| CH[2].TEP        | 0x524  | Channel 2 task end-point      |
| CH[3].EEP        | 0x528  | Channel 3 event end-point     |
| CH[3].TEP        | 0x52C  | Channel 3 task end-point      |
| CH[4].EEP        | 0x530  | Channel 4 event end-point     |
| CH[4].TEP        | 0x534  | Channel 4 task end-point      |
| CH[5].EEP        | 0x538  | Channel 5 event end-point     |
| CH[5].TEP        | 0x53C  | Channel 5 task end-point      |
| CH[6].EEP        | 0x540  | Channel 6 event end-point     |
| CH[6].TEP        | 0x544  | Channel 6 task end-point      |
| CH[7].EEP        | 0x548  | Channel 7 event end-point     |
| CH[7].TEP        | 0x54C  | Channel 7 task end-point      |
| CH[8].EEP        | 0x550  | Channel 8 event end-point     |
| CH[8].TEP        | 0x554  | Channel 8 task end-point      |
| CH[9].EEP        | 0x558  | Channel 9 event end-point     |
| CH[9].TEP        | 0x55C  | Channel 9 task end-point      |
| CH[10].EEP       | 0x560  | Channel 10 event end-point    |
| CH[10].TEP       | 0x564  | Channel 10 task end-point     |
| CH[11].EEP       | 0x568  | Channel 11 event end-point    |
| CH[11].TEP       | 0x56C  | Channel 11 task end-point     |
| CH[12].EEP       | 0x570  | Channel 12 event end-point    |
| CH[12].TEP       | 0x574  | Channel 12 task end-point     |
| CH[13].EEP       | 0x578  | Channel 13 event end-point    |
| CH[13].TEP       | 0x57C  | Channel 13 task end-point     |
| CH[14].EEP       | 0x580  | Channel 14 event end-point    |
| CH[14].TEP       | 0x584  | Channel 14 task end-point     |
| CH[15].EEP       | 0x588  | Channel 15 event end-point    |
| CH[15].TEP       | 0x58C  | Channel 15 task end-point     |
| CH[16].EEP       | 0x590  | Channel 16 event end-point    |
| CH[16].TEP       | 0x594  | Channel 16 task end-point     |
| CH[17].EEP       | 0x598  | Channel 17 event end-point    |

## 23 RADIO — 2.4 GHz Radio

The RADIO contains a 2.4 GHz radio receiver and a 2.4 GHz radio transmitter that is compatible with Nordic's proprietary 1 Mbps and 2 Mbps radio modes in addition to 1 Mbps and 2 Mbps *Bluetooth*® low energy mode.

EasyDMA in combination with an automated packet assembler and packet disassembler, and an automated CRC generator and CRC checker, makes it very easy to configure and use the RADIO. See [Figure 29: RADIO block diagram](#) on page 205 for details.

**Figure 29: RADIO block diagram**

The RADIO includes a Device Address Match unit and an interframe spacing control unit that can be utilized to simplify address white listing and interframe spacing respectively, in *Bluetooth* Smart and similar applications.

The RADIO also includes a Received Signal Strength Indicator (RSSI) and a bit counter. The bit counter generates events when a preconfigured number of bits have been sent or received by the RADIO.

### 23.1 EasyDMA

The RADIO use EasyDMA for reading and writing of data packets from and to the RAM without CPU involvement.

As illustrated in [Figure 29: RADIO block diagram](#) on page 205, the RADIO's EasyDMA utilizes the same PACKETPTR for receiving and transmitting packets. The CPU should reconfigure this pointer every time before the RADIO is started via the START task.

The structure of a radio packet is described in detail in [Packet configuration](#) on page 206. The data that is stored in Data RAM and transported by EasyDMA consists of S0, LENGTH, S1, the payload itself, and a static add-on sent immediately after the payload.

The size of each of the above elements in the frame is configurable (see [Packet configuration](#) on page 206), and the space occupied in RAM depends on these settings. A size of zero is possible for any of the fields, it is up to the user to make sure that the resulting frame complies with the RF protocol chosen.

For the field sizes defined in bits, the occupation in RAM will always be rounded up to the next full byte size (for instance 3 bit length will allocate 1 byte in RAM, 9 bit length will allocate 2 bytes, etc.).

In addition, the S0INCL field in PCNF0 determines if S0 is present in RAM at all if its length is zero. If present, one byte is allocated in RAM.

The size of S0 is configured through the S0LEN field in PCNF0. The size of LENGTH is configured through the LLEN field in PCNF0. The size of S1 is configured through the S1LEN field in PCNF0. The size of the payload is configured through the value in RAM corresponding to the LENGTH field. The size of the static add-on to the payload is configured through the STATLEN field in PCNF1.

The MAXLEN field in the PCNF1 register configures the maximum packet payload plus add-on size in number of bytes that can be transmitted or received by the RADIO. This feature can be used to ensure that the RADIO does not overwrite, or read beyond, the RAM assigned to the packet payload. This means that if the packet payload length defined by PCNF1.STATLEN and the LENGTH field in the packet specifies a packet larger than MAXLEN, the payload will be truncated at MAXLEN.

Note that MAXLEN includes the payload and the add-on, but excludes the size occupied by the S0, LENGTH and S1 fields. This has to be taken into account when allocating RAM.

If the payload plus add-on length is specified larger than MAXLEN, the RADIO will still transmit or receive in the same way as before except the payload is now truncated to MAXLEN. The packet's LENGTH field will not be altered when the payload is truncated. The RADIO will calculate CRC as if the packet length is equal to MAXLEN.

If the PACKETPTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 23 for more information about the different memory regions.

The DISABLED event indicates that the EasyDMA has finished accessing the RAM.

## 23.2 Packet configuration

A Radio packet contains the following fields: PREAMBLE, ADDRESS, S0, LENGTH, S1, PAYLOAD and CRC.

See [Figure 30: On-air packet layout](#) on page 206. Not shown in the figure is the static payload add-on (the length of which is defined in STATLEN, and which is 0 bytes long in a standard BLE packet), and would be sent between PAYLOAD and CRC. The Radio sends the different fields in the packet in the order they are illustrated below, from left to right. The preamble will be sent least significant bit first on-air.

**Figure 30: On-air packet layout**

For all modes, except for 2 Mbit/s Bluetooth Low Energy mode, the preamble is one byte long. For 2 Mbit/s Bluetooth Low Energy mode the preamble is 2 bytes long. If the first bit of the ADDRESS is 0 the preamble will be set to 0xAA otherwise the PREAMBLE will be set to 0x55.

Radio packets are stored in memory inside instances of a radio packet data structure as illustrated in [Figure 31: In-RAM representation of radio packet, S0, LENGTH and S1 are optional](#) on page 206. The PREAMBLE, ADDRESS and CRC fields are omitted in this data structure.

**Figure 31: In-RAM representation of radio packet, S0, LENGTH and S1 are optional**

The byte ordering on air is always Least Significant Byte First for the ADDRESS and PAYLOAD fields and Most Significant Byte First for the CRC field. The ADDRESS fields are always transmitted and received least significant bit first on-air. The CRC field is always transmitted and received Most Significant Bit first. The bit-endian, i.e. which order the bits are sent and received in, of the S0, LENGTH, S1 and PAYLOAD fields can be configured via the ENDIAN in PCNF1.

The S0INCL field in PCNF0 determines if S0 is present in RAM at all if its length is zero. If present, one byte is allocated in RAM.

The sizes of the S0, LENGTH and S1 fields can be individually configured via S0LEN, LLEN and S1LEN in PCNF0 respectively. If any of these fields are configured to be less than 8 bit long the, the least significant bits of the fields, as seen from the RAM representation, are used.

If S0, LENGTH or S1 are specified with zero length their fields will be omitted in memory, otherwise each field will be represented as a separate byte, regardless of the number of bits in their on-air counterpart.

## 23.3 Maximum packet length

Independent of the configuration of MAXLEN, the combined length of S0, LENGTH, S1 and PAYLOAD cannot exceed 258 bytes.

## 23.4 Address configuration

The on-air radio ADDRESS field is composed of two parts, the base address field and the address prefix field.

The size of the base address field is configurable via BALEN in PCNF1. The base address is truncated from LSByte if the BALEN is less than 4. See [Table 38: Definition of logical addresses](#) on page 207.

The on-air addresses are defined in the BASEn and PREFIXn registers, and it is only when writing these registers the user will have to relate to actual on-air addresses. For other radio address registers such as the TXADDRESS, RXADDRESSES and RXMATCH registers, logical radio addresses ranging from 0 to 7 are being used. The relationship between the on-air radio addresses and the logical addresses is described in [Table 38: Definition of logical addresses](#) on page 207.

**Table 38: Definition of logical addresses**

| Logical address | Base address | Prefix byte |
|-----------------|--------------|-------------|
| 0               | BASE0        | PREFIX0.AP0 |
| 1               | BASE1        | PREFIX0.AP1 |
| 2               | BASE1        | PREFIX0.AP2 |
| 3               | BASE1        | PREFIX0.AP3 |
| 4               | BASE1        | PREFIX1.AP4 |
| 5               | BASE1        | PREFIX1.AP5 |
| 6               | BASE1        | PREFIX1.AP6 |
| 7               | BASE1        | PREFIX1.AP7 |

## 23.5 Data whitening

The RADIO is able to do packet whitening and de-whitening.

See WHITEEN in PCNF1 register for how to enable whitening. When enabled, whitening and de-whitening will be handled by the RADIO automatically as packets are sent and received.

The whitening word is generated using polynomial  $g(D) = D^7 + D^4 + 1$ , which then is XORed with the data packet that is to be whitened, or de-whitened. See the figure below.

**Figure 32: Data whitening and de-whitening**

Whitening and de-whitening will be performed over the whole packet (except for the preamble and the address field).

The linear feedback shift register, illustrated in [Figure 32: Data whitening and de-whitening](#) on page 208 can be initialised via the DATAWHITEIV register.

## 23.6 CRC

The CRC generator in the RADIO calculates the CRC over the whole packet excluding the preamble. If desirable, the address field can be excluded from the CRC calculation as well

See CRCCNF register for more information.

The CRC polynomial is configurable as illustrated in [Figure 33: CRC generation of an n bit CRC](#) on page 208 where bit 0 in the CRCPOLY register corresponds to  $X^0$  and bit 1 corresponds to  $X^1$  etc. See CRCPOLY for more information.

**Figure 33: CRC generation of an n bit CRC**

As illustrated in [Figure 33: CRC generation of an n bit CRC](#) on page 208, the CRC is calculated by feeding the packet serially through the CRC generator. Before the packet is clocked through the CRC generator, the CRC generator's latches  $b_0$  through  $b_n$  will be initialized with a predefined value specified in the CRCINIT register. When the whole packet is clocked through the CRC generator, latches  $b_0$  through  $b_n$  will hold the resulting CRC. This value will be used by the RADIO during both transmission and reception but it is not available to be read by the CPU at any time. A received CRC can however be read by the CPU via the RXCRC register independent of whether or not it has passed the CRC check.

The length ( $n$ ) of the CRC is configurable, see CRCCNF for more information.

After the whole packet including the CRC has been received, the RADIO will generate a CRCOK event if no CRC errors were detected, or alternatively generate a CRCERROR event if CRC errors were detected.

The status of the CRC check can be read from the CRCSTATUS register after a packet has been received.

## 23.7 Radio states

The RADIO can enter a number of states.

The RADIO can enter the states described the table below. An overview state diagram for the RADIO is illustrated in [Figure 34: Radio states](#) on page 209. This figure shows how the tasks and events relate to the RADIO's operation. The RADIO does not prevent a task from being triggered from the wrong state. If a task is triggered from the wrong state, for example if the RXEN task is triggered from the RXDISABLE state, this may lead to incorrect behaviour. As illustrated in [Figure 34: Radio states](#) on page 209, the PAYLOAD event is always generated even if the payload is zero.

**Table 39: RADIO state diagram**

| State     | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| DISABLED  | No operations are going on inside the radio and the power consumption is at a minimum                |
| RXRU      | The radio is ramping up and preparing for reception                                                  |
| RXIDLE    | The radio is ready for reception to start                                                            |
| RX        | Reception has been started and the addresses enabled in the RXADDRESSES register are being monitored |
| TXRU      | The radio is ramping up and preparing for transmission                                               |
| TXIDLE    | The radio is ready for transmission to start                                                         |
| TX        | The radio is transmitting a packet                                                                   |
| RXDISABLE | The radio is disabling the receiver                                                                  |
| TXDISABLE | The radio is disabling the transmitter                                                               |
